Kantorovich Initiative Seminar
November 30, 2023

## Outline

1 Unbalanced Optimal Transport: a relaxation viewpoint
2. The Hellinger-Kantorovich metric between positive measures of arbitrary mass

3 Geodesics and geodesic convexity

4 Regularity of solutions to the Conical Hopf-Lax semigroup

## Unbalanced Optimal Transport starting from Dirac masses

$X_{i}$ Polish topological spaces (the topology is induced by a separable and complete metric).
$\mathcal{M}(X)$ is the space of nonnegative Borel measures $\mu$ on $X$ with finite mass $\mu(X)<\infty$.

## Unbalanced Optimal Transport starting from Dirac masses

$X_{i}$ Polish topological spaces (the topology is induced by a separable and complete metric).
$\mathcal{M}(X)$ is the space of nonnegative Borel measures $\mu$ on $X$ with finite mass $\mu(X)<\infty$.
We introduce a function $\mathrm{h}:\left(\mathrm{X}_{0} \times \mathbb{R}_{+}\right) \times\left(\mathrm{X}_{1} \times \mathbb{R}_{+}\right) \rightarrow[0,+\infty]$ which characterizes the cost of connecting two Dirac measures with possibly different mass:

$$
\mathrm{h}\left(x_{0}, r_{0} ; x_{1}, r_{1}\right):=\operatorname{UOT}_{\text {Dirac }}\left(r_{0} \delta_{x_{0}}, r_{1} \delta_{x_{1}}\right) \quad x_{i} \in X_{i}, r_{i} \geqslant 0
$$

## Unbalanced Optimal Transport starting from Dirac masses

$X_{i}$ Polish topological spaces (the topology is induced by a separable and complete metric).
$\mathcal{M}(X)$ is the space of nonnegative Borel measures $\mu$ on $X$ with finite mass $\mu(X)<\infty$.
We introduce a function $\mathrm{h}:\left(\mathrm{X}_{0} \times \mathbb{R}_{+}\right) \times\left(\mathrm{X}_{1} \times \mathbb{R}_{+}\right) \rightarrow[0,+\infty]$ which characterizes the cost of connecting two Dirac measures with possibly different mass:

$$
\mathrm{h}\left(\mathrm{x}_{0}, \mathrm{r}_{0} ; \mathrm{x}_{1}, \mathrm{r}_{1}\right):=\operatorname{UOT}_{\text {Dirac }}\left(\mathrm{r}_{0} \delta_{x_{0}}, \mathrm{r}_{1} \delta_{x_{1}}\right) \quad x_{i} \in X_{i}, \mathrm{r}_{\mathrm{i}} \geqslant 0
$$

Simplifying assumptions: for every $\mathrm{x}_{0}, \mathrm{x}_{1}$

$$
\left\{\begin{array}{l}
h\left(x_{0}, r_{0} ; x_{1}, 0\right) \text { is independent of } x_{1}, h\left(x_{0}, 0 ; x_{1}, r_{1}\right) \text { is independent of } x_{0} . \\
\left(r_{0}, r_{1}\right) \mapsto h\left(x_{0}, r_{0} ; x_{1}, r_{1}\right) \quad \text { is positively 1-homogeneous and convex }
\end{array}\right.
$$

## Unbalanced Optimal Transport starting from Dirac masses

$X_{i}$ Polish topological spaces (the topology is induced by a separable and complete metric).
$\mathcal{M}(X)$ is the space of nonnegative Borel measures $\mu$ on $X$ with finite mass $\mu(X)<\infty$.
We introduce a function $\mathrm{h}:\left(\mathrm{X}_{0} \times \mathbb{R}_{+}\right) \times\left(\mathrm{X}_{1} \times \mathbb{R}_{+}\right) \rightarrow[0,+\infty]$ which characterizes the cost of connecting two Dirac measures with possibly different mass:

$$
\mathrm{h}\left(\mathrm{x}_{0}, \mathrm{r}_{0} ; \mathrm{x}_{1}, \mathrm{r}_{1}\right):=\operatorname{UOT}_{\text {Dirac }}\left(\mathrm{r}_{0} \delta_{x_{0}}, \mathrm{r}_{1} \delta_{x_{1}}\right) \quad x_{i} \in X_{i}, r_{i} \geqslant 0
$$

Simplifying assumptions: for every $\mathrm{x}_{0}, \mathrm{x}_{1}$

$$
\left\{\begin{array}{l}
h\left(x_{0}, r_{0} ; x_{1}, 0\right) \quad \text { is independent of } x_{1}, \quad h\left(x_{0}, 0 ; x_{1}, r_{1}\right) \text { is independent of } x_{0} . \\
\left(r_{0}, r_{1}\right) \mapsto h\left(x_{0}, r_{0} ; x_{1}, r_{1}\right) \quad \text { is positively 1-homogeneous and convex }
\end{array}\right.
$$

Cone space: identify all the points $(x, 0)$ with the vertex $\mathfrak{o}$ (they correspond to the null measure $0 \delta_{x}=0$ )

$$
\mathfrak{C}[X]:=(X \times[0, \infty)) / \sim, \quad\left(x^{\prime}, r^{\prime}\right) \sim\left(x^{\prime \prime}, r^{\prime \prime}\right) \quad \Leftrightarrow \quad\left\{\begin{array}{l}
x^{\prime}=x^{\prime \prime}, r^{\prime}=r^{\prime \prime} \neq 0 \\
r^{\prime}=r^{\prime \prime}=0
\end{array}\right.
$$

## Examples

The Balanced OT case: $c: X_{0} \times X_{1} \rightarrow \mathbb{R}$ is a cost function,

$$
h\left(x_{0}, r_{0} ; x_{1}, r_{1}\right)= \begin{cases}r c\left(x_{0}, x_{1}\right) & \text { if } r_{0}=r_{1}=r \\ +\infty & \text { if } r_{0} \neq r_{1}\end{cases}
$$

## Examples

The Balanced OT case: c : $\mathrm{X}_{0} \times \mathrm{X}_{1} \rightarrow \mathbb{R}$ is a cost function,

$$
h\left(x_{0}, r_{0} ; x_{1}, r_{1}\right)= \begin{cases}r c\left(x_{0}, x_{1}\right) & \text { if } r_{0}=r_{1}=r \\ +\infty & \text { if } r_{0} \neq r_{1}\end{cases}
$$

The Hellinger-Kakutani case:

$$
h\left(x_{0}, r_{0} ; x_{1}, r_{1}\right)= \begin{cases}\left(\sqrt{r_{0}}-\sqrt{r_{1}}\right)^{2}=r_{0}+r_{1}-2 \sqrt{r_{0} r_{1}} & \text { if } x_{0}=x_{1} \\ +\infty & \text { if } x_{0} \neq x_{1}\end{cases}
$$

## Examples

The Balanced OT case: c : $X_{0} \times X_{1} \rightarrow \mathbb{R}$ is a cost function,

$$
h\left(x_{0}, r_{0} ; x_{1}, r_{1}\right)= \begin{cases}r c\left(x_{0}, x_{1}\right) & \text { if } r_{0}=r_{1}=r \\ +\infty & \text { if } r_{0} \neq r_{1}\end{cases}
$$

The Hellinger-Kakutani case:

$$
h\left(x_{0}, r_{0} ; x_{1}, r_{1}\right)= \begin{cases}\left(\sqrt{r_{0}}-\sqrt{r_{1}}\right)^{2}=r_{0}+r_{1}-2 \sqrt{r_{0} r_{1}} & \text { if } x_{0}=x_{1} \\ +\infty & \text { if } x_{0} \neq x_{1}\end{cases}
$$

The Entropic Unbalanced Cost

$$
\begin{aligned}
h\left(x_{0}, r_{0} ; x_{1}, r_{1}\right) & =r_{0}+r_{1}-2 \sqrt{r_{0} r_{1}} e^{-c\left(x_{0}, x_{1}\right)} \\
& =\left(\sqrt{r_{0}}-\sqrt{r_{1}}\right)^{2}+2 \sqrt{r_{0} r_{1}}\left(1-e^{-c\left(x_{0}, x_{1}\right)}\right)
\end{aligned}
$$

## Unbalanced Optimal Transport as convex envelope

What is the most natural way (from the convex analysis viewpoint) to extend UOT $_{\text {Dirac }}$

$$
\mathrm{h}\left(x_{0}, r_{0} ; x_{1}, r_{1}\right):=\operatorname{UOT}_{\text {Dirac }}\left(r_{0} \delta_{x_{0}}, r_{1} \delta_{x_{1}}\right) \quad x_{i} \in X_{i}, r_{i} \geqslant 0
$$

to a function in $\mathcal{M}\left(\mathrm{X}_{0}\right) \times \mathcal{N}\left(\mathrm{X}_{1}\right)$ ?

## Unbalanced Optimal Transport as convex envelope

What is the most natural way (from the convex analysis viewpoint) to extend UOT $_{\text {Dirac }}$

$$
\mathrm{h}\left(\mathrm{x}_{0}, \mathrm{r}_{0} ; \mathrm{x}_{1}, \mathrm{r}_{1}\right):=\text { UOT }_{\text {Dirac }}\left(\mathrm{r}_{0} \delta_{x_{0}}, \mathrm{r}_{1} \delta_{x_{1}}\right) \quad x_{i} \in X_{i}, r_{i} \geqslant 0
$$

to a function in $\mathcal{M}\left(X_{0}\right) \times \mathcal{M}\left(X_{1}\right)$ ?
$\Gamma$-relaxation of UOT ${ }_{\text {Dirac }}$ : the largest convex and I.s.c. functional $\Gamma$-UOT Dirac $: \mathcal{N}\left(X_{0}\right) \times \mathcal{M}\left(X_{1}\right) \rightarrow[0,+\infty]$ dominated by UOT Dirac :

$$
\left\{\begin{array}{l}
\Gamma-\text { UOT }_{\text {Dirac }}\left(r_{0} \delta_{x_{0}}, r_{1} \delta_{x_{1}}\right) \leqslant \text { UOT }_{\text {Dirac }}\left(r_{0} \delta_{x_{0}}, r_{1} \delta_{x_{1}}\right) \text { for every } r_{i} \geqslant 0, x_{i} \in X_{i} \\
\text { UÔTconvex, I.s.c., UÔT } \leqslant \text { UOT }_{\text {Dirac }} \Rightarrow \text { UÔT } \leqslant \Gamma \text {-UOT }{ }_{\text {Dirac }} .
\end{array}\right.
$$

## Two equivalent constructions

If $\mathscr{F}: \mathrm{V} \rightarrow(-\infty,+\infty]$ is a given function, defined in a vector space V in duality with $\mathrm{V}^{\prime}$, its $\Gamma$-regularization can be characterized in two equivalent ways:

- Using the Legendre transform thanks to Fenchel-Moreau Theorem:

$$
\begin{aligned}
\mathscr{F}^{*}(\phi) & :=\sup _{v \in \mathrm{~V}}\langle\phi, v\rangle-\mathscr{F}(v), \quad \phi \in \mathrm{V}^{\prime} \\
\Gamma-\mathscr{F}(v) & =\mathscr{F}^{* *}(v):=\sup _{\phi \in \mathrm{V}^{\prime}}\langle\phi, v\rangle-\mathscr{F}^{*}(\phi)
\end{aligned}
$$

## Two equivalent constructions

If $\mathscr{F}: \mathrm{V} \rightarrow(-\infty,+\infty]$ is a given function, defined in a vector space V in duality with $\mathrm{V}^{\prime}$, its $\Gamma$-regularization can be characterized in two equivalent ways:

- Using the Legendre transform thanks to Fenchel-Moreau Theorem:

$$
\begin{aligned}
\mathscr{F}^{*}(\phi) & :=\sup _{v \in \mathrm{~V}}\langle\phi, v\rangle-\mathscr{F}(v), \quad \phi \in \mathrm{V}^{\prime} \\
\Gamma-\mathscr{F}(v) & =\mathscr{F}^{* *}(v):=\sup _{\phi \in \mathrm{V}^{\prime}}\langle\phi, v\rangle-\mathscr{F}^{*}(\phi)
\end{aligned}
$$

- Computing the convex envelope:

$$
\operatorname{co} \mathscr{F}(v):=\inf \left\{\sum_{i} \alpha_{i} \mathscr{F}\left(v_{i}\right): \alpha_{i} \geqslant 0, \sum_{i} \alpha_{i}=1, \sum_{i} \alpha_{i} v_{i}=v\right\}
$$

and then taking the I.s.c. relaxation of $\operatorname{co} \mathscr{F}(v)$. If $\mathscr{F}$ is coercive we have the integral description

$$
\Gamma-\mathscr{F}(v)=\min \left\{\int_{V} \mathscr{F}(w) \mathrm{d} \alpha(w): \alpha \in \mathcal{P}(\mathrm{V}), \int_{V} w \mathrm{~d} \alpha(w)=v\right\} .
$$

## Convex duality

$\Gamma$-UOT ${ }_{\text {Dirac }}$ can be computed by Legendre transform thanks to Fenchel-Moreau Theorem, using the duality between $\mathcal{M}(X)$ and $\mathrm{C}_{\mathrm{b}}(\mathrm{X})$.

$$
\begin{aligned}
\operatorname{UOT}_{\text {Dirac }}^{*}\left(\phi_{0}, \phi_{1}\right) & =\sup \left\{r_{0} \phi_{0}\left(x_{0}\right)+r_{1} \phi_{1}\left(x_{1}\right)-h\left(x_{0}, r_{0} ; x_{1}, r_{1}\right): r_{i} \geqslant 0, x_{i} \in X_{i}\right\} \\
& = \begin{cases}0 & \text { if } r_{0} \phi_{0}\left(x_{0}\right)+r_{1} \phi_{1}\left(x_{1}\right) \leqslant h\left(x_{0}, r_{0} ; x_{1}, r_{1}\right) \\
+\infty & \text { otherwise }\end{cases}
\end{aligned}
$$

## Convex duality

$\Gamma$-UOT ${ }_{\text {Dirac }}$ can be computed by Legendre transform thanks to Fenchel-Moreau Theorem, using the duality between $\mathcal{M}(X)$ and $\mathrm{C}_{\mathrm{b}}(\mathrm{X})$.

$$
\begin{aligned}
\operatorname{UOT}_{\text {Dirac }}^{*}\left(\phi_{0}, \phi_{1}\right) & =\sup \left\{r_{0} \phi_{0}\left(x_{0}\right)+r_{1} \phi_{1}\left(x_{1}\right)-h\left(x_{0}, r_{0} ; x_{1}, r_{1}\right): r_{i} \geqslant 0, x_{i} \in X_{i}\right\} \\
& = \begin{cases}0 & \text { if } r_{0} \phi_{0}\left(x_{0}\right)+r_{1} \phi_{1}\left(x_{1}\right) \leqslant h\left(x_{0}, r_{0} ; x_{1}, r_{1}\right) \\
+\infty & \text { otherwise }\end{cases}
\end{aligned}
$$

UOT $_{\text {Dirac }}^{*}$ is just the indicator function of a convex set $K[h]$ of admissible Kantorovich potentials $\left(\phi_{0}, \phi_{1}\right) \in \mathrm{C}_{\mathrm{b}}\left(\mathrm{X}_{0}\right) \times \mathrm{C}_{\mathrm{b}}\left(\mathrm{X}_{1}\right)$.

The dual Kantorovich formulation of Unbalanced Optimal Transport

$$
\begin{aligned}
\Gamma-\text { UOT }_{\text {Dirac }}\left(\mu_{0}, \mu_{1}\right) & =\operatorname{UOT}_{\text {Dirac }}^{* *}\left(\mu_{0}, \mu_{1}\right)= \\
& =\sup \left\{\int \phi_{0} \mathrm{~d} \mu_{0}+\int \phi_{1} \mathrm{~d} \mu_{1}:\left(\phi_{0}, \phi_{1}\right) \in \mathrm{K}[\mathrm{~h}]\right\} .
\end{aligned}
$$

## Primal formulation

## How to represent convex combinations of pair of Dirac masses?

Given $\alpha_{k} \geqslant 0, \sum_{k} \alpha_{k}=1$, we may consider

$$
\begin{aligned}
\left(\mu_{0}, \mu_{1}\right) & =\sum_{k} \alpha_{k}\left(r_{0, k} \delta_{x_{0, k}}, r_{1, k} \delta_{x_{1, k}}\right) \\
& \rightsquigarrow \Gamma-\text { UOT }_{\text {Dirac }}\left(\mu_{0}, \mu_{1}\right) \leqslant \sum_{k} \alpha_{k} h\left(x_{0, k}, r_{0, k} ; x_{1, k}, r_{1, k}\right)=\int h d \alpha \\
& \rightsquigarrow \alpha=\sum_{k} \alpha_{k} \delta_{\left(x_{0, k}, r_{0, k} ; x_{1, k} r_{1, k}\right)} \in \mathcal{P}\left(X_{0} \times \mathbb{R}_{+} \times X_{1} \times \mathbb{R}_{+}\right)
\end{aligned}
$$

## Primal formulation

## How to represent convex combinations of pair of Dirac masses?

Given $\alpha_{k} \geqslant 0, \sum_{k} \alpha_{k}=1$, we may consider

$$
\begin{aligned}
\left(\mu_{0}, \mu_{1}\right) & =\sum_{k} \alpha_{k}\left(r_{0, k} \delta_{x_{0, k}}, r_{1, k} \delta_{x_{1, k}}\right) \\
& \rightsquigarrow \Gamma-\text { UOT }_{\text {Dirac }}\left(\mu_{0}, \mu_{1}\right) \leqslant \sum_{k} \alpha_{k} h\left(x_{0, k}, r_{0, k} ; x_{1, k}, r_{1, k}\right)=\int h d \alpha \\
& \rightsquigarrow \alpha=\sum_{k} \alpha_{k} \delta_{\left(x_{0, k}, r_{0, k} ; x_{1, k} r_{1, k}\right)} \in \mathcal{P}\left(X_{0} \times \mathbb{R}_{+} \times X_{1} \times \mathbb{R}_{+}\right)
\end{aligned}
$$

Constraints:

$$
\begin{aligned}
\mu_{0}(A) & =\sum_{k} \alpha_{k} r_{0, k} \delta_{x_{0, k}}(A)=\int_{A \times \mathbb{R}_{+} \times x_{1} \times \mathbb{R}_{+}} r_{0} d \boldsymbol{\alpha}\left(x_{0}, r_{0} ; x_{1}, r_{1}\right) \\
& =\mathfrak{h}_{0} \alpha(A) \\
\mu_{1}(B) & =\sum_{k} \alpha_{k} r_{1, k} \delta_{x_{1, k}}(B)=\int_{X_{0} \times \mathbb{R}_{+} \times B \times \mathbb{R}_{+}} r_{1} d \boldsymbol{\alpha}\left(x_{0}, r_{0} ; x_{1}, r_{1}\right) \\
& =\mathfrak{h}_{1} \boldsymbol{\alpha}(B)
\end{aligned}
$$

$$
\mu_{0}=\mathfrak{h}_{0} \boldsymbol{\alpha}=\pi_{\sharp}^{X_{0}}\left(r_{0} \boldsymbol{\alpha}\right), \quad \mu_{1}=\mathfrak{h}_{1} \boldsymbol{\alpha}=\pi_{\sharp}^{X_{1}}\left(r_{1} \boldsymbol{\alpha}\right) \quad \text { 1-homogeneous marginals of } \boldsymbol{\alpha}
$$

## Representation

We introduce the set of plans with homogeneous marginals $\mu_{0}, \mu_{1}$ :

$$
\begin{aligned}
\mathfrak{H}\left(\mu_{0}, \mu_{1}\right):= & \left\{\alpha \in \mathcal{P}\left(X_{0} \times \mathbb{R}_{+} \times X_{1} \times \mathbb{R}_{+}\right):\right. \\
& \left.\mathfrak{h}_{0} \boldsymbol{\alpha}=\pi_{\sharp}^{x_{0}}\left(r_{0} \boldsymbol{\alpha}\right)=\mu_{0}, \mathfrak{h}_{1} \boldsymbol{\alpha}=\pi_{\sharp}^{x_{1}}\left(r_{1} \boldsymbol{\alpha}\right)=\mu_{1}\right\}
\end{aligned}
$$

## Representation

We introduce the set of plans with homogeneous marginals $\mu_{0}, \mu_{1}$ :

$$
\begin{aligned}
\mathfrak{H}\left(\mu_{0}, \mu_{1}\right):= & \left\{\alpha \in \mathcal{P}\left(X_{0} \times \mathbb{R}_{+} \times X_{1} \times \mathbb{R}_{+}\right):\right. \\
& \left.\mathfrak{h}_{0} \boldsymbol{\alpha}=\pi_{\sharp}^{x_{0}}\left(r_{0} \alpha\right)=\mu_{0}, \mathfrak{h}_{1} \alpha=\pi_{\sharp}^{x_{1}}\left(r_{1} \alpha\right)=\mu_{1}\right\}
\end{aligned}
$$

Primal formulation

$$
\operatorname{UOT}\left(\mu_{0}, \mu_{1}\right)=\min \left\{\int h\left(x_{0}, r_{0} ; x_{1}, r_{1}\right) d \boldsymbol{\alpha}: \boldsymbol{\alpha} \in \mathfrak{H}\left(\mu_{0}, \mu_{1}\right)\right\}
$$

## Representation

We introduce the set of plans with homogeneous marginals $\mu_{0}, \mu_{1}$ :

$$
\begin{aligned}
\mathfrak{H}\left(\mu_{0}, \mu_{1}\right):= & \left\{\alpha \in \mathcal{P}\left(X_{0} \times \mathbb{R}_{+} \times X_{1} \times \mathbb{R}_{+}\right):\right. \\
& \left.\mathfrak{h}_{0} \boldsymbol{\alpha}=\pi_{\sharp}^{x_{0}}\left(r_{0} \boldsymbol{\alpha}\right)=\mu_{0}, \mathfrak{h}_{1} \alpha=\pi_{\sharp}^{x_{1}}\left(r_{1} \boldsymbol{\alpha}\right)=\mu_{1}\right\}
\end{aligned}
$$

## Primal formulation

$$
\operatorname{UOT}\left(\mu_{0}, \mu_{1}\right)=\min \left\{\int \mathrm{h}\left(\mathrm{x}_{0}, \mathrm{r}_{0} ; \mathrm{x}_{1}, \mathrm{r}_{1}\right) \mathrm{d} \boldsymbol{\alpha}: \boldsymbol{\alpha} \in \mathfrak{H}\left(\mu_{0}, \mu_{1}\right)\right\}
$$

It is possible to check that UOT is convex, l.s.c., and it is dominated by UOT ${ }_{\text {Dirac }}$, so that

$$
\operatorname{UOT}\left(\mu_{0}, \mu_{1}\right) \leqslant \operatorname{UOT}_{\text {Dirac }}^{* *}\left(\mu_{0}, \mu_{1}\right)
$$

On the other hand it is also immediate to check that

$$
\operatorname{UOT}\left(\mu_{0}, \mu_{1}\right) \geqslant \operatorname{UOT}_{\text {Dirac }}^{* *}\left(\mu_{0}, \mu_{1}\right)
$$

## Primal-dual equivalence of Unbalanced Optimal Transport

$$
\begin{aligned}
& \operatorname{UOT}\left(\mu_{0}, \mu_{1}\right)=\text { UOT }_{\text {Dirac }}^{* *}\left(\mu_{0}, \mu_{1}\right)=\sup \left\{\int \phi_{0} d \mu_{0}+\int \phi_{1} d \mu_{1}:\left(\phi_{0}, \phi_{1}\right) \in \mathrm{K}[\mathrm{~h}]\right\}, \\
& \mathrm{K}[\mathrm{~h}]=\left\{\left(\phi_{0}, \phi_{1}\right) \in \mathrm{C}_{\mathrm{b}}\left(\mathrm{X}_{0}\right) \times \mathrm{C}_{\mathrm{b}}\left(\mathrm{X}_{1}\right): \mathrm{r}_{0} \phi_{0}\left(\mathrm{x}_{0}\right)+\mathrm{r}_{1} \phi_{1}\left(\mathrm{x}_{1}\right) \leqslant \mathrm{h}\left(x_{0}, \mathrm{r}_{0} ; \mathrm{x}_{1}, \mathrm{r}_{1}\right)\right\} .
\end{aligned}
$$

## The link with Optimal Transport in the cone space

Consider the space $\mathfrak{C}\left[X_{i}\right]=\left(X_{i} \times \mathbb{R}_{+}\right) / \sim$ and the cost functional $h$. It induces the OT problem

$$
\mathrm{OT}_{\mathrm{h}}\left(\alpha_{0}, \alpha_{1}\right)=\min \left\{\int h \mathrm{~d} \alpha: \alpha \in \Gamma\left(\alpha_{1}, \alpha_{2}\right)\right\} .
$$

We have

## Optimal transport formulation via homogeneous marginals

$$
\operatorname{UOT}\left(\mu_{0}, \mu_{1}\right)=\min \left\{\operatorname{OT}_{\mathrm{h}}\left(\alpha_{0}, \alpha_{1}\right): \alpha_{i} \in \mathcal{P}\left(\mathfrak{C}\left[X_{i}\right]\right), \mathfrak{h} \alpha_{i}=\mu_{i}\right\}
$$

where

$$
\mathfrak{h} \alpha_{i}=\pi_{\sharp}^{X_{i}}\left(r_{i} \alpha_{i}\right) .
$$

## The link with Optimal Transport in the cone space

Consider the space $\mathfrak{C}\left[X_{i}\right]=\left(X_{i} \times \mathbb{R}_{+}\right) / \sim$ and the cost functional $h$. It induces the OT problem

$$
\mathrm{OT}_{\mathrm{h}}\left(\alpha_{0}, \alpha_{1}\right)=\min \left\{\int h \mathrm{~d} \alpha: \alpha \in \Gamma\left(\alpha_{1}, \alpha_{2}\right)\right\} .
$$

We have

## Optimal transport formulation via homogeneous marginals

$$
\operatorname{UOT}\left(\mu_{0}, \mu_{1}\right)=\min \left\{\operatorname{OT}_{h}\left(\alpha_{0}, \alpha_{1}\right): \alpha_{i} \in \mathcal{P}\left(\mathfrak{C}\left[X_{i}\right]\right), \mathfrak{h} \alpha_{i}=\mu_{i}\right\}
$$

where

$$
\mathfrak{h} \alpha_{i}=\pi_{\sharp}^{X_{i}}\left(r_{i} \alpha_{i}\right) .
$$

How to choose interesting costs h? We discuss the particular case of the hellinger-Kantorovich metric, induced by the natural cone distance on $\mathfrak{C}\left[\mathbb{R}^{\mathrm{d}}\right]$.

## Outline

1 Unbalanced Optimal Transport: a relaxation viewpoint

2 The Hellinger-Kantorovich metric between positive measures of arbitrary mass

3 Geodesics and geodesic convexity

4 Regularity of solutions to the Conical Hopf-Lax semigroup

## The dynamic perspective

Let $\mu \in C^{0}\left([0,1] ; \mathcal{M}\left(\mathbb{R}^{\mathrm{d}}\right)\right),(\boldsymbol{v}, w): \mathbb{R}^{\mathrm{d}} \times(0,1) \rightarrow \mathbb{R}^{\mathrm{d}+1}$ be a Borel vector field satisfying

$$
\int_{0}^{1} \int\left(\left|v_{t}(x)\right|^{2}+w_{t}^{2}(x)\right) d \mu_{t}(x) d t<\infty
$$

Continuity equation with reaction governed by the field $(\boldsymbol{v}, \boldsymbol{w})$ if

$$
\begin{equation*}
\partial_{\mathrm{t}} \mu_{\mathrm{t}}+\nabla \cdot\left(v_{\mathrm{t}} \mu_{\mathrm{t}}\right)=2 w_{\mathrm{t}} \mu_{\mathrm{t}} \quad \text { in } \mathscr{D}^{\prime}\left(\mathbb{R}^{\mathrm{d}} \times(0,1)\right) \tag{CER}
\end{equation*}
$$

## The dynamic perspective

Let $\mu \in C^{0}\left([0,1] ; \mathcal{M}\left(\mathbb{R}^{\mathrm{d}}\right)\right),(\boldsymbol{v}, w): \mathbb{R}^{\mathrm{d}} \times(0,1) \rightarrow \mathbb{R}^{\mathrm{d}+1}$ be a Borel vector field satisfying

$$
\int_{0}^{1} \int\left(\left|v_{\mathrm{t}}(x)\right|^{2}+w_{\mathrm{t}}^{2}(x)\right) \mathrm{d} \mu_{\mathrm{t}}(x) \mathrm{dt}<\infty
$$

Continuity equation with reaction governed by the field $(\boldsymbol{v}, \boldsymbol{w})$ if

$$
\begin{equation*}
\partial_{\mathrm{t}} \mu_{\mathrm{t}}+\nabla \cdot\left(v_{\mathrm{t}} \mu_{\mathrm{t}}\right)=2 w_{\mathrm{t}} \mu_{\mathrm{t}} \quad \text { in } \mathscr{D}^{\prime}\left(\mathbb{R}^{\mathrm{d}} \times(0,1)\right) \tag{CER}
\end{equation*}
$$

The Hellinger-Kantorovich distance via dynamic interpolation

$$
\begin{aligned}
\mathbb{H}^{2}\left(\mu_{0}, \mu_{1}\right)=\min \{ & \int_{0}^{1} \int\left(\left|v_{t}\right|^{2}+\left|w_{t}\right|^{2}\right) d \mu_{t} d t: \mu \in C\left([0,1] ; \mathcal{N}\left(\mathbb{R}^{d}\right)\right) \\
& \left.\partial_{t} \mu_{t}+\nabla \cdot\left(v_{t} \mu_{t}\right)=2 w_{t} \mu_{t}, \quad \mu_{t=i}=\mu_{i}\right\}
\end{aligned}
$$

This approach has been independently proposed by
Kondratiev, Monsaingeon, Vorotnikov and Chizat, Peyré, Vialard, Schmitzer.

## The distances between two Dirac masses

Suppose that $\mu_{i}=r_{i}^{2} \delta_{x_{i}}$; if we look for $\mu_{t}:=r^{2}(t) \delta_{x(t)}$

$$
\partial_{\mathrm{t}} \mu_{\mathrm{t}}+\nabla \cdot\left(\mu_{\mathrm{t}} v_{\mathrm{t}}\right)=2 w_{\mathrm{t}} \mu_{\mathrm{t}}, \quad v_{\mathrm{t}}(x(\mathrm{t}))=\dot{\mathrm{x}}(\mathrm{t}), \quad w_{\mathrm{t}}(\mathrm{x}(\mathrm{t}))=\dot{\mathrm{r}}(\mathrm{t}) / \mathrm{r}(\mathrm{t})
$$

We can compute

$$
\begin{aligned}
\mathrm{H}^{2}\left(\mathrm{r}_{0}^{2} \delta_{x_{0}}, r_{1}^{2} \delta_{x_{1}}\right)=\min \{ & \int_{0}^{1}\left(\mathrm{r}^{2}(\mathrm{t})|\dot{x}(\mathrm{t})|^{2}+|\dot{r}(\mathrm{t})|^{2}\right) d t: \\
& \left.(x, r):[0,1] \rightarrow \mathbb{R}^{\mathrm{d}} \times \mathbb{R}_{+},(x(i), r(i))=\left(x_{i}, r_{i}\right) i=0,1\right\}
\end{aligned}
$$

## The distances between two Dirac masses

Suppose that $\mu_{i}=r_{i}^{2} \delta_{x_{i}}$; if we look for $\mu_{t}:=r^{2}(t) \delta_{x(t)}$

$$
\partial_{\mathrm{t}} \mu_{\mathrm{t}}+\nabla \cdot\left(\mu_{\mathrm{t}} v_{\mathrm{t}}\right)=2 w_{\mathrm{t}} \mu_{\mathrm{t}}, \quad v_{\mathrm{t}}(\mathrm{x}(\mathrm{t}))=\dot{\mathrm{x}}(\mathrm{t}), \quad w_{\mathrm{t}}(\mathrm{x}(\mathrm{t}))=\dot{\mathrm{r}}(\mathrm{t}) / \mathrm{r}(\mathrm{t})
$$

We can compute

$$
\begin{aligned}
\mathrm{H}^{2}\left(\mathrm{r}_{0}^{2} \delta_{x_{0}}, r_{1}^{2} \delta_{x_{1}}\right)=\min \{ & \int_{0}^{1}\left(\mathrm{r}^{2}(\mathrm{t})|\dot{x}(\mathrm{t})|^{2}+|\dot{r}(\mathrm{t})|^{2}\right) d \mathrm{t}: \\
& \left.(x, r):[0,1] \rightarrow \mathbb{R}^{\mathrm{d}} \times \mathbb{R}_{+},(x(i), r(i))=\left(x_{i}, r_{i}\right) i=0,1\right\}
\end{aligned}
$$

K is associated to the cone distance:

$$
d_{\mathbb{C}}^{2}\left(\left(x_{0}, r_{0}\right),\left(x_{1}, r_{1}\right)\right)=r_{0}^{2}+r_{1}^{2}-2 r_{0} r_{1} \cos _{\pi}\left(\left|x_{1}-x_{0}\right|\right)
$$

where $\cos _{\alpha}(r)=\cos (r \wedge \alpha) \cdot d_{\mathfrak{C}}\left(\left(x_{0}, r_{0}\right),\left(x_{1}, r_{1}\right)\right)$ is a length distance.

## The distances between two Dirac masses

Suppose that $\mu_{i}=r_{i}^{2} \delta_{x_{i}}$; if we look for $\mu_{t}:=r^{2}(t) \delta_{x(t)}$

$$
\partial_{\mathrm{t}} \mu_{\mathrm{t}}+\nabla \cdot\left(\mu_{\mathrm{t}} v_{\mathrm{t}}\right)=2 w_{\mathrm{t}} \mu_{\mathrm{t}}, \quad v_{\mathrm{t}}(\mathrm{x}(\mathrm{t}))=\dot{\mathrm{x}}(\mathrm{t}), \quad w_{\mathrm{t}}(\mathrm{x}(\mathrm{t}))=\dot{\mathrm{r}}(\mathrm{t}) / \mathrm{r}(\mathrm{t})
$$

We can compute

$$
\begin{aligned}
\mathrm{K}^{2}\left(r_{0}^{2} \delta_{x_{0}}, r_{1}^{2} \delta_{x_{1}}\right)=\min \{ & \int_{0}^{1}\left(r^{2}(t)|\dot{x}(t)|^{2}+|\dot{r}(t)|^{2}\right) d t: \\
& \left.(x, r):[0,1] \rightarrow \mathbb{R}^{d} \times \mathbb{R}_{+},(x(i), r(i))=\left(x_{i}, r_{i}\right) i=0,1\right\}
\end{aligned}
$$

## K is associated to the cone distance:

$$
d_{\mathfrak{C}}^{2}\left(\left(x_{0}, r_{0}\right),\left(x_{1}, r_{1}\right)\right)=r_{0}^{2}+r_{1}^{2}-2 r_{0} r_{1} \cos _{\pi}\left(\left|x_{1}-x_{0}\right|\right)
$$

where $\cos _{\alpha}(r)=\cos (r \wedge \alpha) . d_{\mathfrak{C}}\left(\left(x_{0}, r_{0}\right),\left(x_{1}, r_{1}\right)\right)$ is a length distance.
Truncation effect: when $\left|x_{0}-x_{1}\right| \geqslant \pi / 2$ a better competitor is provided by $\mu_{t}:=\left[(1-t) r_{0}\right]^{2} \delta_{x_{0}}+\left(\operatorname{tr}_{1}\right)^{2} \delta_{x_{1}}$ and we have

$$
\boldsymbol{H}^{2}\left(r_{0}^{2} \delta_{x_{0}}, r_{1}^{2} \delta_{x_{1}}\right)=r_{0}^{2}+r_{1}^{2}
$$

## The distances between two Dirac masses

Suppose that $\mu_{i}=r_{i}^{2} \delta_{x_{i}}$; if we look for $\mu_{t}:=r^{2}(t) \delta_{x(t)}$

$$
\partial_{\mathrm{t}} \mu_{\mathrm{t}}+\nabla \cdot\left(\mu_{\mathrm{t}} v_{\mathrm{t}}\right)=2 w_{\mathrm{t}} \mu_{\mathrm{t}}, \quad v_{\mathrm{t}}(\mathrm{x}(\mathrm{t}))=\dot{\mathrm{x}}(\mathrm{t}), \quad w_{\mathrm{t}}(\mathrm{x}(\mathrm{t}))=\dot{\mathrm{r}}(\mathrm{t}) / \mathrm{r}(\mathrm{t})
$$

We can compute

$$
\begin{aligned}
& H^{2}\left(r_{0}^{2} \delta_{x_{0}}, r_{1}^{2} \delta_{x_{1}}\right)=\min \left\{\int_{0}^{1}\left(r^{2}(t)|\dot{x}(t)|^{2}+|\dot{r}(t)|^{2}\right) d t:\right. \\
& \\
& \left.(x, r):[0,1] \rightarrow \mathbb{R}^{d} \times \mathbb{R}_{+},(x(i), r(i))=\left(x_{i}, r_{i}\right) i=0,1\right\}
\end{aligned}
$$

## K is associated to the cone distance:

$$
d_{\mathfrak{C}}^{2}\left(\left(x_{0}, r_{0}\right),\left(x_{1}, r_{1}\right)\right)=r_{0}^{2}+r_{1}^{2}-2 r_{0} r_{1} \cos _{\pi}\left(\left|x_{1}-x_{0}\right|\right)
$$

where $\cos _{\alpha}(r)=\cos (r \wedge \alpha) . d_{\mathfrak{C}}\left(\left(x_{0}, r_{0}\right),\left(x_{1}, r_{1}\right)\right)$ is a length distance.
Truncation effect: when $\left|x_{0}-x_{1}\right| \geqslant \pi / 2$ a better competitor is provided by $\mu_{t}:=\left[(1-t) r_{0}\right]^{2} \delta_{x_{0}}+\left(\operatorname{tr}_{1}\right)^{2} \delta_{x_{1}}$ and we have

$$
\mathrm{H}^{2}\left(\mathrm{r}_{0}^{2} \delta_{x_{0}}, \mathrm{r}_{1}^{2} \delta_{x_{1}}\right)=\mathrm{r}_{0}^{2}+\mathrm{r}_{1}^{2}
$$

$$
\mathrm{H}^{2}\left(\mathrm{r}_{0}^{2} \delta_{x_{0}}, r_{1}^{2} \delta_{x_{1}}\right)=\mathrm{r}_{0}^{2}+\mathrm{r}_{1}^{2}-2 \mathrm{r}_{0} \mathrm{r}_{1} \cos _{\pi / 2}\left(\left|x_{1}-x_{0}\right|\right)
$$

Cone metric: $\quad d_{\mathscr{C}}^{2}\left(\left(x_{0}, r_{0}\right),\left(x_{1}, r_{1}\right)\right)=r_{0}^{2}+r_{1}^{2}-2 r_{0} r_{1} \cos _{\pi}\left(\left|x_{1}-x_{0}\right|\right)$
Cone space: identify all the points $(x, 0)$ with the vertex $\mathfrak{o}$.

$$
\mathfrak{C}:=\left(\mathbb{R}^{\mathrm{d}} \times[0, \infty)\right) / \sim, \quad\left(x^{\prime}, r^{\prime}\right) \sim\left(x^{\prime \prime}, r^{\prime \prime}\right) \quad \Leftrightarrow\left\{\begin{array}{l}
x^{\prime}=x^{\prime \prime}, r^{\prime}=r^{\prime \prime} \neq 0 \\
r^{\prime}=r^{\prime \prime}=0
\end{array}\right.
$$

Cone metric: $\quad d_{\mathbb{C}}^{2}\left(\left(x_{0}, r_{0}\right),\left(x_{1}, r_{1}\right)\right)=r_{0}^{2}+r_{1}^{2}-2 r_{0} r_{1} \cos _{\pi}\left(\left|x_{1}-x_{0}\right|\right)$

## Cone space: identify all the points $(x, 0)$ with the vertex $\mathfrak{o}$.

$$
\mathfrak{C}:=\left(\mathbb{R}^{\mathrm{d}} \times[0, \infty)\right) / \sim, \quad\left(x^{\prime}, r^{\prime}\right) \sim\left(x^{\prime \prime}, r^{\prime \prime}\right) \quad \Leftrightarrow \quad\left\{\begin{array}{l}
x^{\prime}=x^{\prime \prime}, r^{\prime}=r^{\prime \prime} \neq 0 \\
r^{\prime}=r^{\prime \prime}=0
\end{array}\right.
$$

$\mathfrak{C} \backslash\{\mathfrak{o}\}$ can be considered as a smooth Riemannian manifold with metric

## Unbalanced transport: the link with the relaxation viewpoint

$\mathrm{H}^{2}$ is a convex and subadditive functional
We introduce a function $\mathrm{h}:\left(\mathbb{R}^{\mathrm{d}} \times \mathbb{R}_{+}\right)^{2} \rightarrow[0,+\infty)$ which characterizes the cost of connecting two Dirac measures with possibly different mass:

$$
\begin{aligned}
h\left(x_{0}, r_{0} ; x_{1}, r_{1}\right) & :=H^{2}\left(r_{0} \delta_{x_{0}}, r_{1} \delta_{x_{1}}\right)=d_{\mathbb{C}}^{2}\left(\left(x_{0}, \sqrt{r_{0}}\right),\left(x_{1}, \sqrt{r_{1}}\right)\right) \\
& =r_{0}+r_{1}-2 \sqrt{r_{0} r_{1}} \cos _{\pi / 2}\left(\left|x_{1}-x_{0}\right|\right) \quad x_{i} \in X_{i}, r_{i} \geqslant 0
\end{aligned}
$$

## Unbalanced transport: the link with the relaxation viewpoint

## $\boldsymbol{K}^{2}$ is a convex and subadditive functional

We introduce a function $\mathrm{h}:\left(\mathbb{R}^{\mathrm{d}} \times \mathbb{R}_{+}\right)^{2} \rightarrow[0,+\infty)$ which characterizes the cost of connecting two Dirac measures with possibly different mass:

$$
\begin{aligned}
h\left(x_{0}, r_{0} ; x_{1}, r_{1}\right) & :=H^{2}\left(r_{0} \delta_{x_{0}}, r_{1} \delta_{x_{1}}\right)=d_{\mathbb{C}}^{2}\left(\left(x_{0}, \sqrt{r_{0}}\right),\left(x_{1}, \sqrt{r_{1}}\right)\right) \\
& =r_{0}+r_{1}-2 \sqrt{r_{0} r_{1}} \cos _{\pi / 2}\left(\left|x_{1}-x_{0}\right|\right) \quad x_{i} \in X_{i}, r_{i} \geqslant 0
\end{aligned}
$$

$$
\left(r_{0}, r_{1}\right) \mapsto h\left(x_{0}, r_{0} ; x_{1}, r_{1}\right) \quad \text { is positively 1-homogeneous and convex }
$$

thanks to the truncation $\left(-\cos _{\pi / 2} \leqslant 0\right)$. Define $\operatorname{UOT}_{\text {Dirac }}\left(\mu_{0}, \mu_{1}\right):=\mathrm{H}^{2}\left(\mu_{0}, \mu_{1}\right)$ if $\mu_{i}=\mathrm{r}_{i} \delta_{x_{i}},+\infty$ otherwise.

## Unbalanced transport: the link with the relaxation viewpoint

## $\mathrm{K}^{2}$ is a convex and subadditive functional

We introduce a function $\mathrm{h}:\left(\mathbb{R}^{\mathrm{d}} \times \mathbb{R}_{+}\right)^{2} \rightarrow[0,+\infty)$ which characterizes the cost of connecting two Dirac measures with possibly different mass:

$$
\begin{aligned}
h\left(x_{0}, r_{0} ; x_{1}, r_{1}\right) & :=H^{2}\left(r_{0} \delta_{x_{0}}, r_{1} \delta_{x_{1}}\right)=d_{\mathbb{C}}^{2}\left(\left(x_{0}, \sqrt{r_{0}}\right),\left(x_{1}, \sqrt{r_{1}}\right)\right) \\
& =r_{0}+r_{1}-2 \sqrt{r_{0} r_{1}} \cos _{\pi / 2}\left(\left|x_{1}-x_{0}\right|\right) \quad x_{i} \in X_{i}, r_{i} \geqslant 0
\end{aligned}
$$

$$
\left(r_{0}, r_{1}\right) \mapsto h\left(x_{0}, r_{0} ; x_{1}, r_{1}\right) \quad \text { is positively 1-homogeneous and convex }
$$

thanks to the truncation $\left(-\cos _{\pi / 2} \leqslant 0\right)$. Define $\operatorname{UOT}_{\text {Dirac }}\left(\mu_{0}, \mu_{1}\right):=\mathrm{H}^{2}\left(\mu_{0}, \mu_{1}\right)$ if $\mu_{i}=\mathrm{r}_{i} \delta_{x_{i}},+\infty$ otherwise.

## Theorem

$\mathrm{HK}^{2}$ is the $\Gamma$-relaxation of $\mathrm{UOT}_{\text {Dirac }}$ : the largest convex and lower semicontinuous functional defined in $\mathcal{M}\left(\mathbb{R}^{\mathrm{d}}\right) \times \mathcal{M}\left(\mathbb{R}^{\mathrm{d}}\right) \rightarrow[0,+\infty]$ dominated by UOT ${ }_{\text {Dirac }}$ :

UÔT convex, l.s.c., UÔT $\leqslant$ UOT $_{\text {Dirac }} \Rightarrow$ UÔT $\leqslant H^{2}$.

## Representation

$$
\begin{aligned}
\mathfrak{H}\left(\mu_{0}, \mu_{1}\right):= & \left\{\boldsymbol{\alpha} \in \mathcal{P}\left(X_{0} \times \mathbb{R}_{+} \times X_{1} \times \mathbb{R}_{+}\right):\right. \\
& \left.\mathfrak{h}^{0} \boldsymbol{\alpha}=\pi_{\sharp}^{x_{0}}\left(r_{0}^{2} \boldsymbol{\alpha}\right)=\mu_{0}, \mathfrak{h}^{1} \boldsymbol{\alpha}=\pi_{\sharp}^{x_{1}}\left(r_{1}^{2} \boldsymbol{\alpha}\right)=\mu_{1}\right\}
\end{aligned}
$$

## Representation

$$
\begin{aligned}
\mathfrak{H}\left(\mu_{0}, \mu_{1}\right):= & \left\{\boldsymbol{\alpha} \in \mathcal{P}\left(X_{0} \times \mathbb{R}_{+} \times X_{1} \times \mathbb{R}_{+}\right):\right. \\
& \left.\mathfrak{h}^{0} \boldsymbol{\alpha}=\pi_{\sharp}^{x_{0}}\left(r_{0}^{2} \boldsymbol{\alpha}\right)=\mu_{0}, \mathfrak{h}^{1} \boldsymbol{\alpha}=\pi_{\sharp}^{x_{1}}\left(r_{1}^{2} \boldsymbol{\alpha}\right)=\mu_{1}\right\}
\end{aligned}
$$

## Primal formulation

$$
\begin{aligned}
\mathfrak{H}^{2}\left(\mu_{0}, \mu_{1}\right) & =\min \left\{\int h\left(x_{0}, r_{0}^{2} ; x_{1}, r_{1}^{2}\right) d \boldsymbol{\alpha}: \boldsymbol{\alpha} \in \mathfrak{H}\left(\mu_{0}, \mu_{1}\right)\right\} \\
& =\min \left\{\int d_{\mathfrak{C}}^{2}\left(\left(x_{0}, r_{0}\right),\left(x_{1}, r_{1}\right)\right) d \boldsymbol{\alpha}: \boldsymbol{\alpha} \in \mathfrak{H}\left(\mu_{0}, \mu_{1}\right)\right\}
\end{aligned}
$$

## Transport-growth pairs

We can represent $\alpha \in \mathfrak{H}\left(\mu_{0}, \mu_{1}\right)$ as $\alpha=\left(\left(T_{0}, q_{0}\right),\left(T_{1}, q_{1}\right)\right)_{\sharp} \lambda$ where $\lambda \in \mathcal{M}(Y)$, $Y$ is some Polish space, and $\left(\mathbf{T}_{i}, q_{i}\right): Y \rightarrow \mathbb{R}^{d} \times \mathbb{R}_{+}$with $q_{i} \in L^{2}(\boldsymbol{\lambda})$.

## Transport-growth pairs

We can represent $\alpha \in \mathfrak{H}\left(\mu_{0}, \mu_{1}\right)$ as $\alpha=\left(\left(T_{0}, q_{0}\right),\left(T_{1}, q_{1}\right)\right)_{\sharp} \lambda$ where $\lambda \in \mathcal{M}(Y), Y$ is some Polish space, and $\left(\mathbf{T}_{i}, q_{i}\right): Y \rightarrow \mathbb{R}^{d} \times \mathbb{R}_{+}$with $q_{i} \in L^{2}(\boldsymbol{\lambda})$.

We say that $\left(\mathbf{T}_{i}, q_{i}\right)$ is a transport-growth pair. $(\mathbf{T}, q)$ acts on $\boldsymbol{\lambda}$ according to this rule:

$$
(\mathbf{T}, q)_{\star} \lambda:=\mathbf{T}_{\sharp}\left(q^{2} \boldsymbol{\lambda}\right)=\mathfrak{h}\left((\mathbf{T}, q)_{\sharp} \boldsymbol{\lambda}\right),
$$

$$
\begin{aligned}
H^{2}\left(\mu_{0}, \mu_{1}\right)=\min \{ & \int_{Y \times Y}\left(q_{0}^{2}+q_{1}^{2}-2 q_{0} q_{1} \cos _{\pi / 2}\left|T_{0}-T_{1}\right|\right) d \lambda \mid \lambda \in \mathcal{M}(Y), \\
& \text { Y Polish, } \left.\left(\mathbf{T}_{i}, q_{i}\right): Y \rightarrow \mathbb{R}^{d} \times \mathbb{R}_{+}, \mu_{i}:=\left(\mathbf{T}_{i}, q_{i}\right)_{\star} \lambda\right\}
\end{aligned}
$$

moreover, it is not restrictive to choose $Y=\mathfrak{C}\left[\mathbb{R}^{\mathrm{d}}\right] \times \mathfrak{C}\left[\mathbb{R}^{\mathrm{d}}\right]$.

## Transport-growth pairs

We can represent $\alpha \in \mathfrak{H}\left(\mu_{0}, \mu_{1}\right)$ as $\alpha=\left(\left(T_{0}, q_{0}\right),\left(T_{1}, q_{1}\right)\right)_{\sharp} \lambda$ where $\lambda \in \mathcal{M}(Y), Y$ is some Polish space, and $\left(\mathbf{T}_{i}, q_{i}\right): Y \rightarrow \mathbb{R}^{d} \times \mathbb{R}_{+}$with $q_{i} \in L^{2}(\boldsymbol{\lambda})$.

We say that $\left(\mathbf{T}_{i}, q_{i}\right)$ is a transport-growth pair. $(\mathbf{T}, q)$ acts on $\boldsymbol{\lambda}$ according to this rule:

$$
(\mathbf{T}, \mathrm{q})_{\star} \boldsymbol{\lambda}:=\mathbf{T}_{\sharp}\left(\mathrm{q}^{2} \boldsymbol{\lambda}\right)=\mathfrak{h}\left((\mathbf{T}, q)_{\sharp} \boldsymbol{\lambda}\right),
$$

$$
\begin{aligned}
\mathrm{K}^{2}\left(\mu_{0}, \mu_{1}\right)=\min \{ & \int_{Y \times Y}\left(\mathrm{q}_{0}^{2}+\mathrm{q}_{1}^{2}-2 \mathrm{q}_{0} \mathrm{q}_{1} \cos _{\pi / 2}\left|\mathbf{T}_{0}-\mathbf{T}_{1}\right|\right) \mathrm{d} \lambda \mid \lambda \in \mathcal{M}(\mathrm{Y}), \\
& \left.Y \text { Polish, }\left(\mathbf{T}_{\mathrm{i}}, \mathrm{q}_{\mathrm{i}}\right): Y \rightarrow \mathbb{R}^{\mathrm{d}} \times \mathbb{R}_{+}, \mu_{\mathrm{i}}:=\left(\mathbf{T}_{\mathrm{i}}, \mathrm{q}_{\mathrm{i}}\right)_{\star} \lambda\right\} ;
\end{aligned}
$$

moreover, it is not restrictive to choose $Y=\mathfrak{C}\left[\mathbb{R}^{\mathrm{d}}\right] \times \mathfrak{C}\left[\mathbb{R}^{\mathrm{d}}\right]$.

## Problem (Monge formulation of HK)

Given $\mu_{0}, \mu_{1} \in \mathcal{M}\left(\mathbb{R}^{\mathrm{d}}\right)$ find an optimal transport-growth pair $(\mathbf{T}, \mathrm{q}): \mathbb{R}^{\mathrm{d}} \rightarrow \mathbb{R}^{\mathrm{d}} \times \mathbb{R}_{+}$minimizing the cost

$$
\begin{equation*}
\mathscr{M}\left(\mathbf{T}, q ; \mu_{0}\right):=\int\left(1+q^{2}(x)-2 q(x) \cos _{\pi / 2}|\mathbf{T}(x)-x|\right) d \mu_{0}(x) \tag{1}
\end{equation*}
$$

among all the transport-growth maps satisfying $(\mathbf{T}, \mathrm{q})_{\star} \mu_{0}=\mu_{1}$

## Duality with the conical Hamilton-Jacobi equation

If

$$
\begin{equation*}
\partial_{t} \xi_{t}+\frac{1}{2}\left|D \xi_{t}\right|^{2}+2 \xi_{t}^{2}(x) \leqslant 0 \tag{CHJ}
\end{equation*}
$$

and

$$
\partial_{\mathrm{t}} \mu_{\mathrm{t}}+\nabla \cdot\left(v_{\mathrm{t}} \mu_{\mathrm{t}}\right)=2 w_{\mathrm{t}} \mu_{\mathrm{t}}
$$

then

$$
\int \xi_{1} \mathrm{~d} \mu_{1}-\int \xi_{0} \mathrm{~d} \mu_{0} \leqslant \frac{1}{2} \int_{0}^{1} \int\left(\left|v_{\mathrm{t}}\right|^{2}+w_{\mathrm{t}}^{2}\right) \mathrm{d} \mu_{\mathrm{t}} \mathrm{dt} .
$$

## Duality with the conical Hamilton-Jacobi equation

If

$$
\begin{equation*}
\partial_{t} \xi_{t}+\frac{1}{2}\left|D \xi_{t}\right|^{2}+2 \xi_{t}^{2}(x) \leqslant 0 \tag{CHJ}
\end{equation*}
$$

and

$$
\partial_{\mathrm{t}} \mu_{\mathrm{t}}+\nabla \cdot\left(v_{\mathrm{t}} \mu_{\mathrm{t}}\right)=2 w_{\mathrm{t}} \mu_{\mathrm{t}}
$$

then

$$
\int \xi_{1} \mathrm{~d} \mu_{1}-\int \xi_{0} \mathrm{~d} \mu_{0} \leqslant \frac{1}{2} \int_{0}^{1} \int\left(\left|v_{\mathrm{t}}\right|^{2}+w_{\mathrm{t}}^{2}\right) \mathrm{d} \mu_{\mathrm{t}} \mathrm{dt} .
$$

HK in duality with subsolutions to the conical Hamilton-Jacobi equations

$$
\begin{gathered}
\frac{1}{2} \mathbb{K}^{2}\left(\mu_{0}, \mu_{1}\right)=\sup \left\{\int \xi_{1} \mathrm{~d} \mu_{1}-\int \xi_{0} \mathrm{~d} \mu_{0}: \xi \in \mathrm{C}^{1}\left([0,1] ; \operatorname{Lip}\left(\mathbb{R}^{\mathrm{d}}\right)\right)\right. \\
\left.\partial_{\mathrm{t}} \xi_{\mathrm{t}}+\frac{1}{2}\left|\mathrm{D} \xi_{\mathrm{t}}\right|^{2}+2 \xi_{\mathrm{t}}^{2} \leqslant 0\right\}
\end{gathered}
$$

## Conical Hopf-Lax representation formula

Given $\xi_{0} \in \operatorname{Li} p_{\mathrm{b}}\left(\mathbb{R}^{\mathrm{d}}\right)$ with $\xi_{0}>-1 / 2$, the viscosity solution (or the maximal subsolution) of the conical Hamilton Jacobi equation

$$
\begin{equation*}
\partial_{t} \xi_{t}+\frac{1}{2}\left|\mathrm{D} \xi_{t}\right|^{2}+2 \xi_{t}^{2}=0 \tag{CHJ}
\end{equation*}
$$

is given by the conical Hopf-Lax semigroup (cf. BARRON-JENSEN-LIU for different representation formulae)

$$
\begin{equation*}
\mathscr{P}_{\mathrm{t}} \xi(\mathrm{x}):=\inf _{y} \frac{1}{2 \mathrm{t}}\left[1-\frac{\cos _{\pi / 2}^{2}(|y-x|)}{1+2 \mathrm{t} \xi(x)}\right] \tag{CHL}
\end{equation*}
$$

## Conical Hopf-Lax representation formula

Given $\xi_{0} \in \operatorname{Li} \dot{p}_{\mathrm{b}}\left(\mathbb{R}^{\mathrm{d}}\right)$ with $\xi_{0}>-1 / 2$, the viscosity solution (or the maximal subsolution) of the conical Hamilton Jacobi equation

$$
\begin{equation*}
\partial_{t} \xi_{t}+\frac{1}{2}\left|D \xi_{t}\right|^{2}+2 \xi_{t}^{2}=0 \tag{CHJ}
\end{equation*}
$$

is given by the conical Hopf-Lax semigroup (cf. BARRON-JENSEN-LIU for different representation formulae)

$$
\begin{equation*}
\mathscr{P}_{\mathrm{t}} \xi(x):=\inf _{y} \frac{1}{2 t}\left[1-\frac{\cos _{\pi / 2}^{2}(|y-x|)}{1+2 \mathrm{t} \xi(x)}\right] \tag{CHL}
\end{equation*}
$$

## Conical Hopf-Lax representation for HK

$$
\frac{1}{2} \not \mathrm{~K}^{2}\left(\mu_{0}, \mu_{1}\right)=\sup \left\{\int \xi_{1} \mathrm{~d} \mu_{1}-\int \xi_{0} \mathrm{~d} \mu_{0}: \xi_{1}=\mathscr{P}_{1} \xi_{0}\right\}
$$

## Conical lift of the Hopf-Lax formula

Formally, if $\xi$ is a solution of

$$
\begin{equation*}
\partial_{\mathrm{t}} \xi_{\mathrm{t}}+\frac{1}{2}\left|\mathrm{D} \xi_{\mathrm{t}}\right|^{2}+2 \xi_{\mathrm{t}}^{2} \leqslant 0 \tag{CHJ}
\end{equation*}
$$

then $\zeta_{t}(x, r):=\xi_{t}(x) r^{2}$ is a solution of

$$
\begin{equation*}
\partial_{t} \zeta_{t}+\frac{1}{2}\left|\mathrm{D}_{\mathfrak{C}} \zeta_{t}\right|^{2} \leqslant 0 \tag{HJ}
\end{equation*}
$$

since

$$
\frac{1}{2}\left|D_{\mathbb{C}} \zeta\right|^{2}=\frac{1}{2} \mathfrak{g}^{*}\left(D_{x} \zeta, \partial_{r} \zeta\right)=\frac{1}{2}\left(\frac{1}{r^{2}}\left|D_{x} \zeta\right|^{2}+\left(\partial_{r} \zeta\right)^{2}\right)=\left(\frac{1}{2}\left|D \xi_{t}\right|^{2}+2 \xi_{t}^{2}\right) r^{2}
$$

## Conical lift of the Hopf-Lax formula

Formally, if $\xi$ is a solution of

$$
\begin{equation*}
\partial_{\mathrm{t}} \xi_{\mathrm{t}}+\frac{1}{2}\left|\mathrm{D} \xi_{\mathrm{t}}\right|^{2}+2 \xi_{\mathrm{t}}^{2} \leqslant 0 \tag{CHJ}
\end{equation*}
$$

then $\zeta_{t}(x, r):=\xi_{t}(x) r^{2}$ is a solution of

$$
\begin{equation*}
\partial_{\mathrm{t}} \zeta_{\mathrm{t}}+\frac{1}{2}\left|\mathrm{D}_{\mathfrak{C}} \zeta_{\mathrm{t}}\right|^{2} \leqslant 0 \tag{HJ}
\end{equation*}
$$

since

$$
\frac{1}{2}\left|D_{\mathfrak{C}} \zeta\right|^{2}=\frac{1}{2} \mathfrak{g}^{*}\left(D_{x} \zeta, \partial_{r} \zeta\right)=\frac{1}{2}\left(\frac{1}{r^{2}}\left|D_{x} \zeta\right|^{2}+\left(\partial_{r} \zeta\right)^{2}\right)=\left(\frac{1}{2}\left|D \xi_{t}\right|^{2}+2 \xi_{t}^{2}\right) r^{2}
$$

The Hopf-Lax semigroup in $\mathfrak{C}$

$$
\begin{aligned}
\mathscr{D}_{t}^{\mathfrak{c}} \zeta(x, r) & =\min _{y, s} \zeta(y, s)+\frac{1}{2 t} d_{\mathfrak{C}}^{2}((x, r),(y, s)) \\
& =\min _{y, s} \xi(y) s^{2}+\frac{1}{2 t}\left(r^{2}+s^{2}-2 r s \cos \left(|x-y|_{\pi}\right)\right)
\end{aligned}
$$

yields

$$
\mathscr{Q}_{\mathrm{t}}^{\mathfrak{c}} \zeta(x, r)=\xi_{\mathrm{t}}(x) \mathrm{r}^{2}, \quad \xi_{\mathrm{t}}=\mathscr{P}_{\mathrm{t}} \xi
$$

## Dual formulation (II)

Change of variable: $\varphi_{1}:=-\frac{1}{2} \log \left(1-2 \xi_{1}\right), \varphi_{0}:=\frac{1}{2} \log \left(1+2 \xi_{0}\right)$

$$
\begin{gathered}
2 \xi_{1}(y) \leqslant 1-\frac{\cos _{\pi / 2}^{2}(|y-x|)}{1+2 \xi_{0}(x)} \Leftrightarrow \quad \varphi_{1}(y)-\varphi_{0}(x) \leqslant \ell(y-x), \\
\ell(\mathbf{r})=-\frac{1}{2} \log \left(\cos _{\pi / 2}^{2}|\mathbf{r}|\right)=\frac{1}{2} \log \left(1+\tan _{\pi / 2}^{2}|\mathbf{r}|\right), \quad D \ell(\mathbf{r})=\underline{\tan }(\mathbf{r})
\end{gathered}
$$

## Dual formulation (II)

Change of variable: $\varphi_{1}:=-\frac{1}{2} \log \left(1-2 \xi_{1}\right), \varphi_{0}:=\frac{1}{2} \log \left(1+2 \xi_{0}\right)$

$$
\begin{gathered}
2 \xi_{1}(y) \leqslant 1-\frac{\cos _{\pi / 2}^{2}(|y-x|)}{1+2 \xi_{0}(x)} \Leftrightarrow \quad \varphi_{1}(y)-\varphi_{0}(x) \leqslant \ell(y-x), \\
\ell(\mathbf{r})=-\frac{1}{2} \log \left(\cos _{\pi / 2}^{2}|\mathbf{r}|\right)=\frac{1}{2} \log \left(1+\tan _{\pi / 2}^{2}|\mathbf{r}|\right), \quad D \ell(\mathbf{r})=\underline{\tan }(\mathbf{r})
\end{gathered}
$$

## Dual Kantorovich formulation

$$
\begin{aligned}
& \frac{1}{2} H K^{2}\left(\mu_{0}, \mu_{1}\right)=\sup \{ \int \frac{1}{2}\left(1-e^{-2 \varphi_{1}}\right) d \mu_{1}-\int \frac{1}{2}\left(\mathrm{e}^{2 \varphi_{0}}-1\right) \mathrm{d} \mu_{0}: \\
&\left.\varphi_{1}(y)-\varphi_{0}(x) \leqslant \ell(y-x)\right\}
\end{aligned}
$$

The Legendre conjugate of $G(\varphi):=\frac{1}{2}\left(\mathrm{e}^{2 \varphi}-1\right)$ is

$$
\mathrm{G}^{*}(\mathrm{~s})=\frac{1}{2} \mathbb{E}(s), \quad \operatorname{EE}(s):=s \log s-(s-1)
$$

## Primal formulation: Logarithmic Entropy-Transport problem

The Legendre conjugate of $G(\varphi):=\frac{1}{2}\left(\mathrm{e}^{2 \varphi}-1\right)$ is

$$
\mathrm{G}^{*}(\mathrm{~s})=\frac{1}{2} \mathbb{E}(s), \quad \operatorname{EE}(s):=s \log s-(s-1)
$$

When $\gamma$ is a plan in $\mathcal{M}\left(\mathbb{R}^{\mathrm{d}} \times \mathbb{R}^{\mathrm{d}}\right)$ with marginals $\gamma_{i}$ we find

## Logarithmic Entropy-Transport (LET) formulation

$$
\mathbb{E T}\left(\mu_{0}, \mu_{1}\right)=\min _{\gamma \in \mathcal{M}\left(\mathbb{R}^{\mathrm{d}} \times \mathbb{R}^{\mathrm{d}}\right)}\left(\mathscr{E}\left(\gamma_{0} \mid \mu_{0}\right)+\mathscr{E}\left(\gamma_{1} \mid \mu_{1}\right)+2 \int \ell(y-x) \mathrm{d} \gamma(x, y)\right)
$$

where $\ell(\mathbf{r})=\frac{1}{2} \log \left(1+\tan _{\pi / 2}^{2}(|\mathbf{r}|)\right)$.

## Primal formulation: Logarithmic Entropy-Transport problem

The Legendre conjugate of $G(\varphi):=\frac{1}{2}\left(\mathrm{e}^{2 \varphi}-1\right)$ is

$$
\mathrm{G}^{*}(\mathrm{~s})=\frac{1}{2} \mathbb{E}(s), \quad \operatorname{EE}(s):=s \log s-(s-1)
$$

When $\gamma$ is a plan in $\mathcal{M}\left(\mathbb{R}^{\mathrm{d}} \times \mathbb{R}^{\mathrm{d}}\right)$ with marginals $\gamma_{i}$ we find

## Logarithmic Entropy-Transport (LET) formulation

$$
\operatorname{EET}\left(\mu_{0}, \mu_{1}\right)=\min _{\gamma \in \mathcal{M}\left(\mathbb{R}^{\mathrm{d}} \times \mathbb{R}^{\mathrm{d}}\right)}\left(\mathscr{E}\left(\gamma_{0} \mid \mu_{0}\right)+\mathscr{E}\left(\gamma_{1} \mid \mu_{1}\right)+2 \int \ell(y-x) \mathrm{d} \boldsymbol{\gamma}(x, y)\right)
$$

where $\ell(\mathbf{r})=\frac{1}{2} \log \left(1+\tan _{\pi / 2}^{2}(|\mathbf{r}|)\right)$.

## Outline

1 Unbalanced Optimal Transport: a relaxation viewpoint

2 The Hellinger-Kantorovich metric between positive measures of arbitrary mass

3 Geodesics and geodesic convexity

4 Regularity of solutions to the Conical Hopf-Lax semigroup

## Important properties

- $\left(\mathcal{M}\left(\mathbb{R}^{\mathrm{d}}\right), \mathrm{H}\right)$ is a complete and separable metric space if $X$ is complete and separable; the induced topology coincides with the topology of weak convergence (no bounds on moments are required).

## Important properties

- $\left(\mathcal{M}\left(\mathbb{R}^{\mathrm{d}}\right), \mathrm{K}\right)$ is a complete and separable metric space if $X$ is complete and separable; the induced topology coincides with the topology of weak convergence (no bounds on moments are required).
- $\left(\mathcal{M}\left(\mathbb{R}^{\mathrm{d}}\right), \mathrm{K}\right)$ is geodesic

## Important properties

- $\left(\mathcal{M}\left(\mathbb{R}^{\mathrm{d}}\right), \mathrm{H}\right)$ is a complete and separable metric space if $X$ is complete and separable; the induced topology coincides with the topology of weak convergence (no bounds on moments are required).
- $\left(\mathcal{M}\left(\mathbb{R}^{\mathrm{d}}\right), \mathrm{H}\right)$ is geodesic
- If $\mu_{0} \ll \mathscr{L}^{\mathrm{d}}$ then there exists a unique geodesic connecting $\mu_{0}$ to $\mu_{1}$ and a unique optimal plan $\gamma$ minimizing IET $\left(\mu_{0}, \mu_{1}\right)$.

## Important properties

- $\left(\mathcal{M}\left(\mathbb{R}^{\mathrm{d}}\right), \mathrm{H}\right)$ is a complete and separable metric space if $X$ is complete and separable; the induced topology coincides with the topology of weak convergence (no bounds on moments are required).
- $\left(\mathcal{M}\left(\mathbb{R}^{\mathrm{d}}\right), \mathrm{H}\right)$ is geodesic
- If $\mu_{0} \ll \mathscr{L}^{\mathrm{d}}$ then there exists a unique geodesic connecting $\mu_{0}$ to $\mu_{1}$ and a unique optimal plan $\gamma$ minimizing IET $\left(\mu_{0}, \mu_{1}\right)$.

## Problem

Characterize geodesics and study the convexity properties of integral functionals.

In particular, we want to prove that power-like entropies

$$
\mathscr{E}_{\alpha}(\mu):=\int c^{\alpha} d x, \quad \mu=c \mathscr{L}^{\mathrm{d}}
$$

are geodesically convex if $\alpha \geqslant 1$ (reinforced McCann condition).

## The $\pi / 2$ treshold and K geodesics between Dirac masses

$$
\mu_{0}=r_{0}^{2} \delta_{x_{0}}, \mu_{1}=r_{1}^{2} \delta_{x_{1}},\left|x_{1}-x_{0}\right| \in[0, \pi], \mu_{t}:=r_{t} \delta_{x_{t}} \text { geodesic. }
$$

Initial velocities $(u, v) \in \mathbb{R} \times \mathbb{R}^{\mathrm{d}}$

$$
u:=\frac{r_{1}}{r_{0}} \cos \left(\left|x_{1}-x_{0}\right|\right)-1 \quad v:=\frac{r_{1}}{r_{0}} \underline{\sin \left(x_{1}-x_{0}\right), \quad \underline{\sin (w)}:=\sin (|\boldsymbol{w}|) \frac{w}{|\boldsymbol{w}|}, ~(w)}
$$

curve:

$$
\mathrm{r}_{\mathrm{t}}:=\mathrm{r}_{0}\left((1+\mathrm{tu})^{2}+\mathrm{t}^{2}|\boldsymbol{v}|^{2}\right)^{1 / 2}, \quad x_{\mathrm{t}}:=\mathrm{x}_{0}+\underline{\arctan }\left(\frac{\mathrm{tv}}{1+\mathrm{tu}}\right)
$$

## Regularity of optimal potentials for the LET formulation

## Theorem

For every $\mu_{0}, \mu_{1} \in \mathcal{M}\left(\mathbb{R}^{\mathrm{d}}\right)$ there exists a pair of optimal potentials $\left(\varphi_{0}, \varphi_{1}\right)$ such that $\varphi_{1}(y)-\varphi_{0}(x) \leqslant 2 \ell(y-x)$ and

$$
\mathrm{K}^{2}\left(\mu_{0}, \mu_{1}\right)=\int\left(1-\mathrm{e}^{-2 \varphi_{1}}\right) \mathrm{d} \mu_{1}-\int\left(\mathrm{e}^{2 \varphi_{0}}-1\right) \mathrm{d} \mu_{0} .
$$

## Regularity of optimal potentials for the LET formulation

## Theorem

For every $\mu_{0}, \mu_{1} \in \mathcal{M}\left(\mathbb{R}^{d}\right)$ there exists a pair of optimal potentials $\left(\varphi_{0}, \varphi_{1}\right)$ such that $\varphi_{1}(y)-\varphi_{0}(x) \leqslant 2 \ell(y-x)$ and

$$
\mathbf{K}^{2}\left(\mu_{0}, \mu_{1}\right)=\int\left(1-e^{-2 \varphi_{1}}\right) d \mu_{1}-\int\left(e^{2 \varphi_{0}}-1\right) d \mu_{0} .
$$

The Optimal potential $\varphi_{0}$ is locally semiconcave outside a closed ( $\mathrm{d}-1$ )-rectifiable set.

## Regularity of optimal potentials for the LET formulation

## Theorem

For every $\mu_{0}, \mu_{1} \in \mathcal{M}\left(\mathbb{R}^{d}\right)$ there exists a pair of optimal potentials $\left(\varphi_{0}, \varphi_{1}\right)$ such that $\varphi_{1}(y)-\varphi_{0}(x) \leqslant 2 \ell(y-x)$ and

$$
\mathbf{K}^{2}\left(\mu_{0}, \mu_{1}\right)=\int\left(1-e^{-2 \varphi_{1}}\right) d \mu_{1}-\int\left(e^{2 \varphi_{0}}-1\right) d \mu_{0} .
$$

The Optimal potential $\varphi_{0}$ is locally semiconcave outside a closed ( $\mathrm{d}-1$ )-rectifiable set.
When $\mu_{0} \ll \mathscr{L}^{\mathrm{d}}$ and $\mu_{1}\left\{y \in \mathbb{R}^{\mathrm{d}}: \mathrm{d}\left(\mathrm{y}\right.\right.$, $\left.\left.\operatorname{supp}\left(\mu_{0}\right)\right) \geqslant \pi / 2\right\}=0$, then Monge formulation has a unique solution $(\mathbf{T}, \mathbf{q})$ such that $(\mathbf{T}, \mathbf{q}) * \mu_{0}=\mu_{1}$ and

$$
\underline{\tan }(\mathbf{T}(x)-x)=\nabla \varphi_{0}(x), \quad q^{2}(x)=\left(e^{2 \varphi_{0}(x)}\right)^{2}+\frac{1}{4}\left|\nabla \mathrm{e}^{2 \varphi_{0}}(x)\right|^{2}
$$

## Regularity of optimal potentials for the LET formulation

## Theorem

For every $\mu_{0}, \mu_{1} \in \mathcal{M}\left(\mathbb{R}^{\mathrm{d}}\right)$ there exists a pair of optimal potentials $\left(\varphi_{0}, \varphi_{1}\right)$ such that $\varphi_{1}(y)-\varphi_{0}(x) \leqslant 2 \ell(y-x)$ and

$$
\mathbf{K}^{2}\left(\mu_{0}, \mu_{1}\right)=\int\left(1-e^{-2 \varphi_{1}}\right) d \mu_{1}-\int\left(e^{2 \varphi_{0}}-1\right) d \mu_{0} .
$$

The Optimal potential $\varphi_{0}$ is locally semiconcave outside a closed ( $\mathrm{d}-1$ )-rectifiable set.
When $\mu_{0} \ll \mathscr{L}^{\mathrm{d}}$ and $\mu_{1}\left\{y \in \mathbb{R}^{\mathrm{d}}: \mathrm{d}\left(\mathrm{y}, \operatorname{supp}\left(\mu_{0}\right)\right) \geqslant \pi / 2\right\}=0$, then Monge formulation has a unique solution $(\mathbf{T}, \mathbf{q})$ such that $(\mathbf{T}, \mathbf{q}) * \mu_{0}=\mu_{1}$ and

$$
\underline{\tan }(\mathbf{T}(x)-x)=\nabla \varphi_{0}(x), \quad q^{2}(x)=\left(e^{2 \varphi_{0}(x)}\right)^{2}+\frac{1}{4}\left|\nabla \mathrm{e}^{2 \varphi_{0}}(x)\right|^{2}
$$

After the transformation $\xi_{0}:=\frac{1}{2}\left(\mathrm{e}^{2 \varphi_{0}}-1\right)$ we can identify

$$
\mathbf{T}(x)=x+\underline{\arctan }\left(\frac{\nabla \xi_{0}}{1+2 \xi_{0}}\right), \quad q^{2}=\left(1+2 \xi_{0}\right)^{2}+\left|\nabla \xi_{0}\right|^{2}
$$

## Regularity of optimal potentials for the LET formulation

## Theorem

For every $\mu_{0}, \mu_{1} \in \mathcal{M}\left(\mathbb{R}^{\mathrm{d}}\right)$ there exists a pair of optimal potentials $\left(\varphi_{0}, \varphi_{1}\right)$ such that $\varphi_{1}(y)-\varphi_{0}(x) \leqslant 2 \ell(y-x)$ and

$$
\mathbf{K}^{2}\left(\mu_{0}, \mu_{1}\right)=\int\left(1-e^{-2 \varphi_{1}}\right) d \mu_{1}-\int\left(e^{2 \varphi_{0}}-1\right) d \mu_{0} .
$$

The Optimal potential $\varphi_{0}$ is locally semiconcave outside a closed $(\mathrm{d}-1)$-rectifiable set.
When $\mu_{0} \ll \mathscr{L}^{\mathrm{d}}$ and $\mu_{1}\left\{y \in \mathbb{R}^{\mathrm{d}}: \mathrm{d}\left(\mathrm{y}, \operatorname{supp}\left(\mu_{0}\right)\right) \geqslant \pi / 2\right\}=0$, then Monge formulation has a unique solution $(\mathbf{T}, \mathbf{q})$ such that $(\mathbf{T}, q){ }_{*} \mu_{0}=\mu_{1}$ and

$$
\underline{\tan }(\mathbf{T}(x)-x)=\nabla \varphi_{0}(x), \quad q^{2}(x)=\left(e^{2 \varphi_{0}(x)}\right)^{2}+\frac{1}{4}\left|\nabla \mathrm{e}^{2 \varphi_{0}}(x)\right|^{2}
$$

After the transformation $\xi_{0}:=\frac{1}{2}\left(\mathrm{e}^{2 \varphi_{0}}-1\right)$ we can identify

$$
\begin{array}{|c}
\hline \mathbf{T}(x)=x+\underline{\arctan }\left(\frac{\nabla \xi_{0}}{1+2 \xi_{0}}\right), \quad q^{2}=\left(1+2 \xi_{0}\right)^{2}+\left|\nabla \xi_{0}\right|^{2} \\
\mathcal{H K}^{2}\left(\mu_{0}, \mu_{1}\right)=\mathscr{M}\left(\mathbf{T}, q ; \mu_{0}\right)=\int_{\mathbb{R}^{\mathrm{d}}}\left(4 \xi_{0}^{2}+\left|\nabla \xi_{0}\right|^{2}\right) \mathrm{d} \mu_{0} \\
\hline
\end{array}
$$

Tangent space: $\operatorname{Tan}_{\mu_{0}} \mathcal{M}\left(\mathbb{R}^{\mathrm{d}}\right)=\mathrm{H}^{1,2}\left(\mathbb{R}^{\mathrm{d}}, \mu_{0}\right)$.

## Geodesics

## Recalling

$$
\mathbf{T}(x)=x+\underline{\arctan }\left(\frac{\nabla \xi_{0}}{1+2 \xi_{0}}\right), \quad q^{2}=\left(1+2 \xi_{0}\right)^{2}+\left|\nabla \xi_{0}\right|^{2}
$$

the geodesic interpolations can be obtained by rescaling $\xi_{0} \rightsquigarrow \mathrm{t} \xi_{0}, \mathrm{t} \in[0,1]$ :

$$
\mathrm{T}_{0 \rightarrow \mathrm{t}}(\mathrm{x}):=\mathrm{x}+\underline{\arctan }\left(\frac{\mathrm{t} \nabla \xi_{0}}{1+2 \mathrm{t} \xi_{0}(\mathrm{x})}\right), \quad \mathrm{q}_{0 \rightarrow \mathrm{t}}^{2}(\mathrm{x}):=\left(1+2 \mathrm{t} \xi_{0}(\mathrm{x})\right)^{2}+\mathrm{t}^{2}\left|\nabla \xi_{0}(\mathrm{x})\right|^{2}
$$

They provide an explicit characterization of the unique HK geodesic connecting $\mu_{0}$ to $\mu_{1}$ :

$$
\mu_{\mathrm{t}}=\left(\mathbf{T}_{0 \rightarrow \mathrm{t}}, \mathrm{q}_{0 \rightarrow \mathrm{t}}\right)_{*} \mu_{0}, \quad \mu_{\mathrm{t}}=\mathrm{c}_{\mathrm{t}} \mathscr{L}^{\mathrm{d}}, \quad \mathrm{c}_{\mathrm{t}}\left(\mathbf{T}_{0 \rightarrow \mathrm{t}}(\mathrm{x})\right)=\mathrm{c}_{0}(\mathrm{x}) \frac{\mathrm{q}_{0 \rightarrow \mathrm{t}}^{2}(\mathrm{x})}{\operatorname{det} D T_{0 \rightarrow \mathrm{t}}(\mathrm{x})}
$$

## Geodesics

Recalling

$$
\mathbf{T}(x)=x+\underline{\arctan }\left(\frac{\nabla \xi_{0}}{1+2 \xi_{0}}\right), \quad q^{2}=\left(1+2 \xi_{0}\right)^{2}+\left|\nabla \xi_{0}\right|^{2}
$$

the geodesic interpolations can be obtained by rescaling $\xi_{0} \rightsquigarrow \mathrm{t} \xi_{0}, \mathrm{t} \in[0,1]$ :

$$
\mathrm{T}_{0 \rightarrow \mathrm{t}}(\mathrm{x}):=\mathrm{x}+\underline{\arctan }\left(\frac{\mathrm{t} \nabla \xi_{0}}{1+2 \mathrm{t} \xi_{0}(x)}\right), \quad \mathrm{q}_{0 \rightarrow \mathrm{t}}^{2}(\mathrm{x}):=\left(1+2 \mathrm{t} \xi_{0}(x)\right)^{2}+\mathrm{t}^{2}\left|\nabla \xi_{0}(x)\right|^{2}
$$

They provide an explicit characterization of the unique HK geodesic connecting $\mu_{0}$ to $\mu_{1}$ :

$$
\mu_{\mathrm{t}}=\left(\mathbf{T}_{0 \rightarrow \mathrm{t}}, \mathrm{q}_{0 \rightarrow \mathrm{t}}\right)_{*} \mu_{0}, \quad \mu_{\mathrm{t}}=\mathrm{c}_{\mathrm{t}} \mathscr{L}^{\mathrm{d}}, \quad \mathrm{c}_{\mathrm{t}}\left(\mathbf{T}_{0 \rightarrow \mathrm{t}}(\mathrm{x})\right)=\mathrm{c}_{0}(\mathrm{x}) \frac{\mathrm{q}_{0 \rightarrow \mathrm{t}}^{2}(\mathrm{x})}{\operatorname{det} D \mathbf{T}_{0 \rightarrow \mathrm{t}}(\mathrm{x})}
$$

Simplifying assumption: $\mu_{0}, \mu_{1}$ have compact support,

$$
\operatorname{supp}\left(\mu_{1}\right) \subset B_{\pi / 2}\left(\operatorname{supp}\left(\mu_{0}\right)\right), \operatorname{supp}\left(\mu_{0}\right) \subset B_{\pi / 2}\left(\operatorname{supp}\left(\mu_{1}\right)\right) .
$$

Optimal potentials $\varphi_{0}$ and $\xi_{0}$ are semiconvex, $\varphi_{1}$ and $\xi_{1}$ are semiconcave, all the functions are globally Lipschitz and for suitable constants $a, b \in \mathbb{R}$

$$
-\frac{1}{2}<-a \leqslant \xi_{0}(x) \leqslant b, \quad-b \leqslant \xi_{1}(y) \leqslant a<\frac{1}{2} .
$$

## Dynamic optimality conditions for geodesics

## Theorem (Formal)

A continuous curve $(\mu)_{t \in[0,1]}$ is a geodesic if and only if there exists a curve $\left(\xi_{t}\right)_{t \in[0,1]}$ such that

$$
\left\{\begin{aligned}
\partial_{\mathrm{t}} \mu_{\mathrm{t}}+\nabla \cdot\left(\mu_{\mathrm{t}} v_{\mathrm{t}}\right) & =2 w_{\mathrm{t}} \mu_{\mathrm{t}} \\
\partial_{\mathrm{t}} \xi_{\mathrm{t}}+\frac{1}{2}\left|\nabla \xi_{\mathrm{t}}\right|^{2}+2 \xi_{\mathrm{t}}^{2} & \leqslant 0 \\
\partial_{\mathrm{t}} \xi_{\mathrm{t}}+\frac{1}{2}\left|\nabla \xi_{\mathrm{t}}\right|^{2}+2 \xi_{\mathrm{t}}^{2} & =0 \quad \text { on the support of } \mu, \\
v_{\mathrm{t}} & =\nabla \xi_{\mathrm{t}} \\
w_{\mathrm{t}} & =2 \xi_{\mathrm{t}}
\end{aligned}\right.
$$

## Dynamic optimality conditions for geodesics

## Theorem (Formal)

\frac{\ddot{\rho}(t)}{\rho(t)}=\frac{1}{d^{2}}\left(\left(\Delta \xi_{t}\right)^{2}-d\left|D^{2} \xi_{t}\right|^{2}\right)+\left(1-\frac{4}{d}\right)\left|\nabla \xi_{t}\right|^{2}
\end{array}\right.
$$

## Theorem

The density $\mathrm{c}(\mathrm{t}, \cdot)$ is convex along the characteristics:

$$
\frac{\ddot{c}}{c} \geqslant 6 \frac{\ddot{q}}{q} \geqslant 0 .
$$

The functional $\mu \mapsto\left\|\mathrm{d} \mu / \mathrm{d} \mathscr{L}^{\mathrm{d}}\right\|_{\mathrm{L}^{\infty}}$ is geodesically convex.

## Application: geodesic convexity of integral functionals

Consider a functional

$$
\mathscr{E}(\mu):=\int E(c(x)) d x, \quad c=\frac{d \mu}{d \mathscr{L}^{d}}
$$

where $E$ is convex (smooth).

## Application: geodesic convexity of integral functionals

Consider a functional

$$
\mathscr{E}(\mu):=\int E(c(x)) d x, \quad c=\frac{d \mu}{d \mathscr{L}^{\mathrm{d}}}
$$

where $E$ is convex (smooth).
The case $\mathrm{E}(\mathrm{c})=\mathrm{c}$ corresponds to the total mass of $\mu$ : it is quadratic.

## Application: geodesic convexity of integral functionals

Consider a functional

$$
\mathscr{E}(\mu):=\int E(c(x)) d x, \quad c=\frac{d \mu}{d \mathscr{L}^{\mathrm{d}}}
$$

where E is convex (smooth).
The case $\mathrm{E}(\mathrm{c})=\mathrm{c}$ corresponds to the total mass of $\mu$ : it is quadratic.
More generally, we set $\varepsilon_{0}(c):=E(c), \varepsilon_{1}(c):=c E^{\prime}(c), \varepsilon_{2}(c):=c^{2} E^{\prime \prime}(c)$.
McCann condition:

$$
\varepsilon_{2}(c) \geqslant\left(1-\frac{1}{d}\right)\left(\varepsilon_{1}(c)-\varepsilon_{0}(c)\right) \geqslant 0 \quad \Leftrightarrow \quad r^{d} E\left(r^{-d}\right) \text { convex, nonincreasing. }
$$

## Application: geodesic convexity of integral functionals

Consider a functional

$$
\mathscr{E}(\mu):=\int E(c(x)) d x, \quad c=\frac{d \mu}{d \mathscr{L}^{\mathrm{d}}}
$$

where $E$ is convex (smooth).
The case $E(c)=c$ corresponds to the total mass of $\mu$ : it is quadratic.
More generally, we set $\varepsilon_{0}(c):=E(c), \varepsilon_{1}(c):=c E^{\prime}(c), \varepsilon_{2}(c):=c^{2} E^{\prime \prime}(c)$.

## McCann condition:

$$
\varepsilon_{2}(c) \geqslant\left(1-\frac{1}{d}\right)\left(\varepsilon_{1}(c)-\varepsilon_{0}(c)\right) \geqslant 0 \quad \Leftrightarrow \quad r^{d} E\left(r^{-d}\right) \text { convex, nonincreasing. }
$$

Convexity with respect to the Hellinger-Kakutani distance:

$$
\varepsilon_{2}(c)+\frac{1}{2} \varepsilon_{0}(c) \geqslant 0 \quad \Leftrightarrow \quad r \mapsto E\left(r^{2}\right) \text { convex. }
$$

## Application: geodesic convexity of integral functionals

Consider a functional

$$
\mathscr{E}(\mu):=\int \mathrm{E}(\mathrm{c}(\mathrm{x})) \mathrm{d} \mathrm{x}, \quad \mathrm{c}=\frac{\mathrm{d} \mu}{\mathrm{~d} \mathscr{L}^{\mathrm{d}}}
$$

where $E$ is convex (smooth).
The case $E(c)=c$ corresponds to the total mass of $\mu$ : it is quadratic.
More generally, we set $\varepsilon_{0}(c):=E(c), \varepsilon_{1}(c):=c E^{\prime}(c), \varepsilon_{2}(c):=c^{2} E^{\prime \prime}(c)$.

## McCann condition:

$$
\varepsilon_{2}(c) \geqslant\left(1-\frac{1}{d}\right)\left(\varepsilon_{1}(c)-\varepsilon_{0}(c)\right) \geqslant 0 \quad \Leftrightarrow \quad r^{d} E\left(r^{-d}\right) \text { convex, nonincreasing. }
$$

## Convexity with respect to the Hellinger-Kakutani distance:

$$
\varepsilon_{2}(c)+\frac{1}{2} \varepsilon_{0}(c) \geqslant 0 \quad \Leftrightarrow \quad r \mapsto E\left(r^{2}\right) \text { convex. }
$$

## Theorem

$\mathscr{E}$ is geodesically convex w.r.t. HK if and only if

$$
G(c):=\left(\begin{array}{cc}
\varepsilon_{2}(c)-\frac{d-1}{d}\left(\varepsilon_{1}(c)-\varepsilon_{0}(c)\right) & \varepsilon_{2}(c)-\frac{1}{2}\left(\varepsilon_{1}(c)-\varepsilon_{0}(c)\right) \\
\varepsilon_{2}(c)-\frac{1}{2}\left(\varepsilon_{1}(c)-\varepsilon_{0}(c)\right) & \varepsilon_{2}(c)+\frac{1}{2} \varepsilon_{1}(c)
\end{array}\right) \geqslant 0, \quad \varepsilon_{1} \geqslant \varepsilon_{0} .
$$

## An equivalent condition

$$
G(c):=\left(\begin{array}{cc}
\varepsilon_{2}(c)-\frac{d-1}{\mathrm{~d}}\left(\varepsilon_{1}(c)-\varepsilon_{0}(c)\right) & \varepsilon_{2}(c)-\frac{1}{2}\left(\varepsilon_{1}(c)-\varepsilon_{0}(c)\right) \\
\varepsilon_{2}(c)-\frac{1}{2}\left(\varepsilon_{1}(c)-\varepsilon_{0}(c)\right) & \varepsilon_{2}(c)+\frac{1}{2} \varepsilon_{1}(c)
\end{array}\right) \geqslant 0, \quad \varepsilon_{1} \geqslant \varepsilon_{0} .
$$

## Theorem

Define

$$
N(\rho, q):=\left(\frac{\rho}{q}\right)^{d} E\left(\frac{q^{d+2}}{\rho^{d}}\right)
$$

$\mathscr{E}$ is geodesically convex if and only if
$\mathrm{N}_{\mathrm{E}}$ is jointly convex and nonincreasing w.r.t. $\rho$.

## An equivalent condition

$$
G(c):=\left(\begin{array}{cc}
\varepsilon_{2}(c)-\frac{d-1}{d}\left(\varepsilon_{1}(c)-\varepsilon_{0}(c)\right) & \varepsilon_{2}(c)-\frac{1}{2}\left(\varepsilon_{1}(c)-\varepsilon_{0}(c)\right) \\
\varepsilon_{2}(c)-\frac{1}{2}\left(\varepsilon_{1}(c)-\varepsilon_{0}(c)\right) & \varepsilon_{2}(c)+\frac{1}{2} \varepsilon_{1}(c)
\end{array}\right) \geqslant 0, \quad \varepsilon_{1} \geqslant \varepsilon_{0} .
$$

## Theorem

Define

$$
N(\rho, q):=\left(\frac{\rho}{q}\right)^{d} E\left(\frac{q^{d+2}}{\rho^{d}}\right)
$$

$\mathscr{E}$ is geodesically convex if and only if
$\mathrm{N}_{\mathrm{E}}$ is jointly convex and nonincreasing w.r.t. $\rho$.

Main examples: the power functions $E(c):=c^{p}$ are convex if $p \geqslant 1$.
In dimension $d=2$ also $E(c)=-\sqrt{c}$ is convex.
In dimension $d=1$ all the power functions $E(c)=-c^{p}, p \in[1 / 3,1 / 2]$ induces convex functionals.

## Outline

1 Unbalanced Optimal Transport: a relaxation viewpoint

2 The Hellinger-Kantorovich metric between positive measures of arbitrary mass

3 Geodesics and geodesic convexity

4 Regularity of solutions to the Conical Hopf-Lax semigroup

## A rigorous proof: regularity of CHL solutions (I)

Conical Hopf-Lax representation formula:

$$
\begin{equation*}
\mathscr{P}_{t} \xi(x):=\inf _{y} \frac{1}{2 t}\left[1-\frac{\cos _{\pi / 2}^{2}(|y-x|)}{1+2 t \xi(x)}\right] \tag{CHL}
\end{equation*}
$$

It is useful to introduce the reverse evolution (Villani '09)

$$
\begin{equation*}
\mathscr{R}_{\mathrm{t}} \bar{\xi}(x):=-\mathscr{P}_{1-\mathrm{t}}(-\bar{\xi})(x)=\sup _{y} \frac{1}{2(1-\mathrm{t})}\left[\frac{\cos _{\pi / 2}^{2}(|y-x|)}{1-2(1-\mathrm{t}) \bar{\xi}(x)}-1\right] \tag{RCHL}
\end{equation*}
$$

## A rigorous proof: regularity of CHL solutions (I)

Conical Hopf-Lax representation formula:

$$
\begin{equation*}
\mathscr{P}_{\mathrm{t}} \xi(x):=\inf _{y} \frac{1}{2 \mathrm{t}}\left[1-\frac{\cos _{\pi / 2}^{2}(|y-x|)}{1+2 \mathrm{t} \xi(x)}\right] \tag{CHL}
\end{equation*}
$$

It is useful to introduce the reverse evolution (Villani '09)

$$
\begin{equation*}
\mathscr{R}_{\mathrm{t}} \bar{\xi}(x):=-\mathscr{P}_{1-\mathrm{t}}(-\bar{\xi})(x)=\sup _{y} \frac{1}{2(1-\mathrm{t})}\left[\frac{\cos _{\pi / 2}^{2}(|y-x|)}{1-2(1-\mathrm{t}) \bar{\xi}(x)}-1\right] \tag{RCHL}
\end{equation*}
$$

## Theorem

If $\xi_{0}: \mathbb{R}^{\mathrm{d}} \rightarrow[-\mathrm{a}, \mathrm{b}]$ with $-1 / 2<-\mathrm{a}<\mathrm{b}<\infty$ then the functions $\xi_{\mathrm{t}}:=\mathscr{P}_{\mathrm{t}} \xi_{0}(\mathrm{x})$ are globally bounded, Lipschitz and semiconcave $\xi_{\mathrm{t}}=\mathscr{P}_{\mathrm{t}-\mathrm{s}} \xi_{\mathrm{s}}, \xi_{1}<1 / 2$.

## A rigorous proof: regularity of CHL solutions (I)

Conical Hopf-Lax representation formula:

$$
\begin{equation*}
\mathscr{P}_{\mathrm{t}} \xi(x):=\inf _{y} \frac{1}{2 \mathrm{t}}\left[1-\frac{\cos _{\pi / 2}^{2}(|y-x|)}{1+2 \mathrm{t} \xi(x)}\right] \tag{CHL}
\end{equation*}
$$

It is useful to introduce the reverse evolution (Villani '09)

$$
\begin{equation*}
\mathscr{R}_{\mathrm{t}} \bar{\xi}(x):=-\mathscr{P}_{1-\mathrm{t}}(-\bar{\xi})(x)=\sup _{y} \frac{1}{2(1-\mathrm{t})}\left[\frac{\cos _{\pi / 2}^{2}(|y-x|)}{1-2(1-\mathrm{t}) \bar{\xi}(x)}-1\right] \tag{RCHL}
\end{equation*}
$$

## Theorem

If $\xi_{0}: \mathbb{R}^{\mathrm{d}} \rightarrow[-\mathrm{a}, \mathrm{b}]$ with $-1 / 2<-\mathrm{a}<\mathrm{b}<\infty$ then the functions $\xi_{\mathrm{t}}:=\mathscr{P}_{\mathrm{t}} \xi_{0}(\mathrm{x})$ are globally bounded, Lipschitz and semiconcave $\xi_{\mathrm{t}}=\mathscr{P}_{\mathrm{t}-\mathrm{s}} \xi_{\mathrm{s}}, \xi_{1}<1 / 2$.

If $\bar{\xi}_{1}: \mathbb{R}^{\mathrm{d}} \rightarrow[-\mathrm{b}, \mathrm{a}]$ with $-\infty<-\mathrm{b}<\mathrm{a}<1 / 2$ then the functions $\bar{\xi}_{\mathrm{t}}:=\mathscr{R}_{\mathrm{t}} \xi_{1}(\mathrm{x})$ are globally bounded, Lipschitz and semiconvex, $\xi_{\mathrm{t}}=\mathscr{P}_{\mathrm{t}-\mathrm{s}} \xi_{\mathrm{s}}, \xi_{1}<1 / 2$.

## Regulairty of CHL (II)

## Theorem (Differentiability on the contact set)

$$
\text { If } \bar{\xi}_{1}=\xi_{1}=\mathscr{P}_{1}\left(\xi_{0}\right), \xi_{0}=\mathscr{R}_{1} \xi_{1} \text { then } \xi_{\mathrm{t}} \geqslant \bar{\xi}_{\mathrm{t}} \text { and the contact set }
$$

$$
\Xi_{t}:=\left\{x: \bar{\xi}_{t}(x)=\xi_{t}(x)\right\} \quad \text { is closed and contains } \operatorname{supp}\left(\mu_{t}\right)
$$

## Regulairty of CHL (II)

## Theorem (Differentiability on the contact set)

If $\bar{\xi}_{1}=\xi_{1}=\mathscr{P}_{1}\left(\xi_{0}\right), \xi_{0}=\mathscr{R}_{1} \xi_{1}$ then $\xi_{\mathrm{t}} \geqslant \bar{\xi}_{\mathrm{t}}$ and the contact set

$$
\Xi_{t}:=\left\{x: \bar{\xi}_{\mathrm{t}}(x)=\xi_{\mathrm{t}}(x)\right\} \quad \text { is closed and contains } \operatorname{supp}\left(\mu_{\mathrm{t}}\right)
$$

$\xi_{\mathrm{t}}, \bar{\xi}_{\mathrm{t}}$ are differentiable in $\Xi_{\mathrm{t}}$ with gradient $\mathrm{g}_{\mathrm{t}}$.

## Regulairty of CHL (II)

## Theorem (Differentiability on the contact set)

If $\bar{\xi}_{1}=\xi_{1}=\mathscr{P}_{1}\left(\xi_{0}\right), \xi_{0}=\mathscr{R}_{1} \xi_{1}$ then $\xi_{\mathrm{t}} \geqslant \bar{\xi}_{\mathrm{t}}$ and the contact set

$$
\Xi_{\mathrm{t}}:=\left\{x: \bar{\xi}_{\mathrm{t}}(x)=\xi_{\mathrm{t}}(x)\right\} \quad \text { is closed and contains } \operatorname{supp}\left(\mu_{\mathrm{t}}\right) \text {. }
$$

$\xi_{\mathrm{t}}, \bar{\xi}_{\mathrm{t}}$ are differentiable in $\Xi_{\mathrm{t}}$ with gradient $\mathrm{g}_{\mathrm{t}}$.
$\mathrm{g}_{\mathrm{t}}$ is Lipschitz in $\Xi_{\mathrm{t}}$ and for every $\mathrm{s}, \mathrm{t} \in[0,1]$ defining

$$
\mathrm{T}_{\mathrm{s} \rightarrow \mathrm{t}}(\mathrm{x}):=\mathrm{x}+\underline{\arctan }\left(\frac{(\mathrm{t}-\mathrm{s}) \mathbf{g}_{\mathrm{s}}(\mathrm{x})}{1+2(\mathrm{t}-\mathrm{s}) \mathbf{g}_{\mathrm{s}}(\mathrm{x})}\right)
$$

the map $\mathrm{T}_{\mathrm{s} \rightarrow \mathrm{t}}$ is Lipschitz, it satisfies $\mathrm{T}_{\mathrm{s} \rightarrow \mathrm{t}}\left(\Xi_{\mathrm{s}}\right)=\Xi_{\mathrm{t}}$ and
the concatenation property $\quad \mathrm{T}_{\mathrm{t}_{1} \rightarrow \mathrm{t}_{2}} \circ \mathrm{~T}_{\mathrm{t}_{0} \rightarrow \mathrm{t}_{1}}=\mathrm{T}_{\mathrm{t}_{0} \rightarrow \mathrm{t}_{2}}$

## Regulairty of CHL (II)

## Theorem (Differentiability on the contact set)

If $\bar{\xi}_{1}=\xi_{1}=\mathscr{P}_{1}\left(\xi_{0}\right), \xi_{0}=\mathscr{R}_{1} \xi_{1}$ then $\xi_{\mathrm{t}} \geqslant \bar{\xi}_{\mathrm{t}}$ and the contact set

$$
\Xi_{t}:=\left\{x: \bar{\xi}_{\mathrm{t}}(x)=\xi_{\mathrm{t}}(x)\right\} \quad \text { is closed and contains } \operatorname{supp}\left(\mu_{\mathrm{t}}\right)
$$

$\xi_{\mathrm{t}}, \bar{\xi}_{\mathrm{t}}$ are differentiable in $\Xi_{\mathrm{t}}$ with gradient $\mathrm{g}_{\mathrm{t}}$.
$\mathrm{g}_{\mathrm{t}}$ is Lipschitz in $\Xi_{\mathrm{t}}$ and for every $\mathrm{s}, \mathrm{t} \in[0,1]$ defining

$$
\mathbf{T}_{s \rightarrow t}(x):=x+\underline{\arctan }\left(\frac{(t-s) \mathbf{g}_{s}(x)}{1+2(t-s) \mathbf{g}_{s}(x)}\right)
$$

the map $\mathrm{T}_{\mathrm{s} \rightarrow \mathrm{t}}$ is Lipschitz, it satisfies $\square$ $\mathrm{T}_{\mathrm{s} \rightarrow \mathrm{t}}\left(\Xi_{\mathrm{s}}\right)=\Xi_{\mathrm{t}}$ and

$$
\text { the concatenation property } \quad \mathrm{T}_{\mathrm{t}_{1} \rightarrow \mathrm{t}_{2}} \circ \mathrm{~T}_{\mathrm{t}_{0} \rightarrow \mathrm{t}_{1}}=\mathrm{T}_{\mathrm{t}_{0} \rightarrow \mathrm{t}_{2}}
$$

Setting

$$
\mathrm{q}_{\mathrm{s} \rightarrow \mathrm{t}}^{2}(x):=\left(1+2(\mathrm{t}-\mathrm{s}) \xi_{s}(x)\right)^{2}+(\mathrm{t}-\mathrm{s})^{2}\left|\mathbf{g}_{\mathrm{s}}(x)\right|^{2}
$$

we have

$$
\mathrm{q}_{\mathrm{t}_{1} \rightarrow \mathrm{t}_{2}} \circ \mathrm{~T}_{\mathrm{t}_{0} \rightarrow \mathrm{t}_{1}} \cdot \mathrm{q}_{\mathrm{t}_{0} \rightarrow \mathrm{t}_{1}}=\mathrm{q}_{\mathrm{t}_{0} \rightarrow \mathrm{t}_{2}}
$$

## Nonbranching and restrictions

## Theorem

For every $s \in(0,1)$ and $t \in[0,1]$ the transport-growth pair $\left(\mathrm{T}_{\mathrm{s} \rightarrow \mathrm{t}}, \mathrm{q}_{\mathrm{s} \rightarrow \mathrm{t}}\right)$ is the unique solution to the Monge formulation for the H problem between $\mu_{\mathrm{s}}$ and $\mu_{\mathrm{t}}$.

## Nonbranching and restrictions

## Theorem

For every $s \in(0,1)$ and $t \in[0,1]$ the transport-growth pair $\left(\mathrm{T}_{\mathrm{s} \rightarrow \mathrm{t}}, \mathrm{q}_{\mathrm{s} \rightarrow \mathrm{t}}\right)$ is the unique solution to the Monge formulation for the H problem between $\mu_{\mathrm{s}}$ and $\mu_{\mathrm{t}}$.

In particular, if for given $\mu_{0}, \mu_{1}, \mu_{\mathrm{s}}$

$$
H K\left(\mu_{0}, \mu_{s}\right)=\operatorname{sHK}\left(\mu_{0}, \mu_{1}\right), \quad H\left(\mu_{s}, \mu_{1}\right)=(1-s) H\left(\mu_{0}, \mu_{1}\right)
$$

then there exists a unique geodesic $\mu:[0,1] \rightarrow \mathcal{M}\left(\mathbb{R}^{d}\right)$ connecting $\mu_{0}$ to $\mu_{1}$ such that $\mu(s)=\mu_{s}$.

## Nonbranching and restrictions

## Theorem

For every $s \in(0,1)$ and $t \in[0,1]$ the transport-growth pair $\left(\mathrm{T}_{\mathrm{s} \rightarrow \mathrm{t}}, \mathrm{q}_{\mathrm{s} \rightarrow \mathrm{t}}\right)$ is the unique solution to the Monge formulation for the H problem between $\mu_{\mathrm{s}}$ and $\mu_{\mathrm{t}}$.

In particular, if for given $\mu_{0}, \mu_{1}, \mu_{\mathrm{s}}$

$$
H K\left(\mu_{0}, \mu_{s}\right)=\operatorname{sHK}\left(\mu_{0}, \mu_{1}\right), \quad H\left(\mu_{s}, \mu_{1}\right)=(1-s) H\left(\mu_{0}, \mu_{1}\right)
$$

then there exists a unique geodesic $\mu:[0,1] \rightarrow \mathcal{M}\left(\mathbb{R}^{d}\right)$ connecting $\mu_{0}$ to $\mu_{1}$ such that $\mu(s)=\mu_{s}$.

If $\mu_{\mathrm{s}} \ll \mathscr{L}^{\mathrm{d}}$ then $\mu_{\mathrm{t}} \ll \mathscr{L}^{\mathrm{d}}$ for every $\mathrm{t} \in(0,1)$.

## Nonbranching and restrictions

## Theorem

For every $s \in(0,1)$ and $t \in[0,1]$ the transport-growth pair $\left(\mathrm{T}_{\mathrm{s} \rightarrow \mathrm{t}}, \mathrm{q}_{\mathrm{s} \rightarrow \mathrm{t}}\right)$ is the unique solution to the Monge formulation for the H problem between $\mu_{\mathrm{s}}$ and $\mu_{\mathrm{t}}$.

In particular, if for given $\mu_{0}, \mu_{1}, \mu_{\text {s }}$

$$
H K\left(\mu_{0}, \mu_{s}\right)=\operatorname{sHK}\left(\mu_{0}, \mu_{1}\right), \quad H\left(\mu_{s}, \mu_{1}\right)=(1-s) H\left(\mu_{0}, \mu_{1}\right)
$$

then there exists a unique geodesic $\mu:[0,1] \rightarrow \mathcal{M}\left(\mathbb{R}^{d}\right)$ connecting $\mu_{0}$ to $\mu_{1}$ such that $\mu(s)=\mu_{s}$.

If $\mu_{\mathrm{s}} \ll \mathscr{L}^{\mathrm{d}}$ then $\mu_{\mathrm{t}} \ll \mathscr{L}^{\mathrm{d}}$ for every $\mathrm{t} \in(0,1)$.
If $\operatorname{supp}\left(\nu_{s}\right) \subset \operatorname{supp}\left(\mu_{\mathrm{s}}\right)$ then $v_{\mathrm{t}}:=\left(\mathrm{T}_{\mathrm{s} \rightarrow \mathrm{t}}, \mathrm{q}_{\mathrm{s} \rightarrow \mathrm{t}}\right)_{*} \mathrm{v}_{\mathrm{s}}$ is a geodesic.

## Second order regularity of CHL (III)

Let $\mathfrak{D}_{s} \subset \Xi_{s}$ the set of points of density 1 where $g_{s}$ is differentiable.

## Theorem

$A_{s}:=\mathrm{D} g_{\mathrm{s}}$ is symmetric. $\xi_{\mathrm{s}}$ has a second order Taylor expansion in terms of $\mathrm{g}_{\mathrm{s}}$ and $\mathrm{A}_{\mathrm{s}}$. We thus can set $\mathrm{g}_{\mathrm{s}}=\nabla \xi_{\mathrm{s}}, \mathrm{B}_{\mathrm{s}}=\mathrm{D} \nabla \xi_{\mathrm{s}}=\mathrm{D}^{2} \xi_{\mathrm{s}}$ in $\mathfrak{D}_{\mathrm{s}}$.

## Second order regularity of CHL (III)

Let $\mathfrak{D}_{\mathrm{s}} \subset \Xi_{\mathrm{s}}$ the set of points of density 1 where $g_{\mathrm{s}}$ is differentiable.

## Theorem

$A_{s}:=\mathrm{D} g_{\mathrm{s}}$ is symmetric. $\xi_{\mathrm{s}}$ has a second order Taylor expansion in terms of $\mathrm{g}_{\mathrm{s}}$ and $\mathrm{A}_{\mathrm{s}}$. We thus can set $\mathrm{g}_{\mathrm{s}}=\nabla \xi_{\mathrm{s}}, \mathrm{B}_{\mathrm{s}}=\mathrm{D} \nabla \xi_{\mathrm{s}}=\mathrm{D}^{2} \xi_{\mathrm{s}}$ in $\mathfrak{D}_{\mathrm{s}}$.

If $\mu_{\mathrm{s}} \ll \mathscr{L}^{\mathrm{d}}$ then $\mu_{\mathrm{s}}\left(\Xi_{\mathrm{s}} \backslash \mathfrak{D}_{\mathrm{s}}\right)=0$.

## Second order regularity of CHL (III)

Let $\mathfrak{D}_{\mathrm{s}} \subset \Xi_{\mathrm{s}}$ the set of points of density 1 where $\mathrm{g}_{\mathrm{s}}$ is differentiable.

## Theorem

$A_{s}:=\mathrm{D} \mathrm{g}_{\mathrm{s}}$ is symmetric. $\xi_{\mathrm{s}}$ has a second order Taylor expansion in terms of $\mathrm{g}_{\mathrm{s}}$ and $\mathrm{A}_{\mathrm{s}}$. We thus can set $\mathrm{g}_{\mathrm{s}}=\nabla \xi_{\mathrm{s}}, \mathrm{B}_{\mathrm{s}}=\mathrm{D} \nabla \xi_{\mathrm{s}}=\mathrm{D}^{2} \xi_{\mathrm{s}}$ in $\mathfrak{D}_{\mathrm{s}}$.

If $\mu_{\mathrm{s}} \ll \mathscr{L}^{\mathrm{d}}$ then $\mu_{\mathrm{s}}\left(\Xi_{\mathrm{s}} \backslash \mathfrak{D}_{\mathrm{s}}\right)=0$.
$\mathrm{T}_{\mathrm{s} \rightarrow \mathrm{t}}$ is differentiable in $\mathfrak{D}_{\mathrm{s}}$ and $\mathrm{T}_{\mathrm{s} \rightarrow \mathrm{t}}\left(\mathfrak{D}_{\mathrm{s}}\right)=\mathfrak{D}_{\mathrm{t}}$.
The maps $\mathbf{T}(\mathrm{t}):=\mathrm{T}_{\mathrm{s} \rightarrow \mathrm{t}}, \mathrm{B}(\mathrm{t}, \cdot):=\mathrm{DT}(\mathrm{t}, \cdot), \delta(\mathrm{t}, \cdot):=\operatorname{det} \mathrm{B}(\mathrm{t}, \cdot)$ are analytic in time and satisfy the characteristic systems of ODE.

$$
\left\{\begin{array}{l}
\ddot{\mathrm{T}}(\mathrm{t})=4 \xi_{\mathrm{t}} \nabla \xi_{\mathrm{t}}(\mathbf{T}(\mathrm{t})) \\
\ddot{\mathrm{q}}(\mathrm{t})=\left|\nabla \xi_{\mathrm{t}}(\mathbf{T}(\mathrm{t}))\right|^{2} \mathrm{q}(\mathrm{t}) \\
\ddot{\mathrm{B}}(\mathrm{t})=-4\left(\nabla \xi_{\mathrm{t}} \otimes \nabla \xi_{\mathrm{t}}+\xi_{\mathrm{t}} \mathrm{D}^{2} \xi_{\mathrm{t}}\right) \circ \mathbf{T}(\mathrm{t}) \cdot \mathrm{B}(\mathrm{t}) \\
\ddot{\delta}(\mathrm{t})=\left(\left(\Delta \xi_{\mathrm{t}}\right)^{2}-\left|\mathrm{D}^{2} \xi_{\mathrm{t}}\right|^{2}-4\left|\nabla \xi_{\mathrm{t}}\right|^{2}-4 \xi_{\mathrm{t}} \Delta \xi_{\mathrm{t}}\right) \circ \mathbf{T}(\mathrm{t}) \cdot \delta(\mathrm{t})
\end{array}\right.
$$
